

# **Quantum Computation & Cryptography**

## **Day 1**

### Introduction

Andru Gheorghiu

# About me

- I'm a theoretical computer scientist
- Postdoctoral researcher at Caltech
- Completed PhD, MSc at University of Edinburgh
- BSc at UPB, Automatica si Calculatoare

Feel free to ask me questions

[gheorghiuandru@gmail.com](mailto:gheorghiuandru@gmail.com)

# About the workshop

- Not a course
- Not a *formal* introduction into quantum information
- ... but there will be maths!
- Intention is to convey the general ideas and principles

**Quantum  
computation**

**Crypto  
quantum  
post-quantum**

**Physics**

# Schedule

## 1. Monday, 20 Aug

- **Introduction:** A brief history of quantum computation and quantum cryptography, what makes them interesting and the current state of the art.
- **What's quantum about quantum computing?:** A simple explanation of what makes quantum special and why quantum algorithms could outperform classical algorithms at certain tasks.

## 2. Tuesday, 21 Aug

- **How to make a physical theory 101:** We'll discuss the core elements that characterize a physical theory, how these apply to quantum mechanics and how this takes us to quantum information.
- **Quantum information basics:** Qubits and quantum gates and how to use them to make quantum algorithms. We'll also look at a simple quantum computation on the IBM quantum chip.

## 3. Wednesday 22 Aug

- **Quantum algorithms:** Continuing with algorithms, we'll look at the quantum algorithms of Simon and Shor.
- **Post-quantum cryptography:** Given that Shor's algorithm compromises the security of many public-key crypto protocols, we'll discuss a potential fix, namely post-quantum cryptography.

## 4. Thursday, 23 Aug

- **Quantum cryptography:** An introduction to quantum cryptography and the BB84 quantum key distribution protocol.
- **Entanglement and device-independence:** We'll see how quantum entanglement allows us to have secure protocols even in the presence of untrusted quantum devices, or so-called device-independent protocols.

## 5. Friday, 24 Aug

- **Quantum hardware:** How do we physically realize qubits and quantum gates? A look at the basics of quantum hardware.
- **Fault tolerance and the future:** We end by discussing how quantum devices can cope with noise and imperfections as well as discuss the outlook for future implementations.

# Romanian Quantum Network

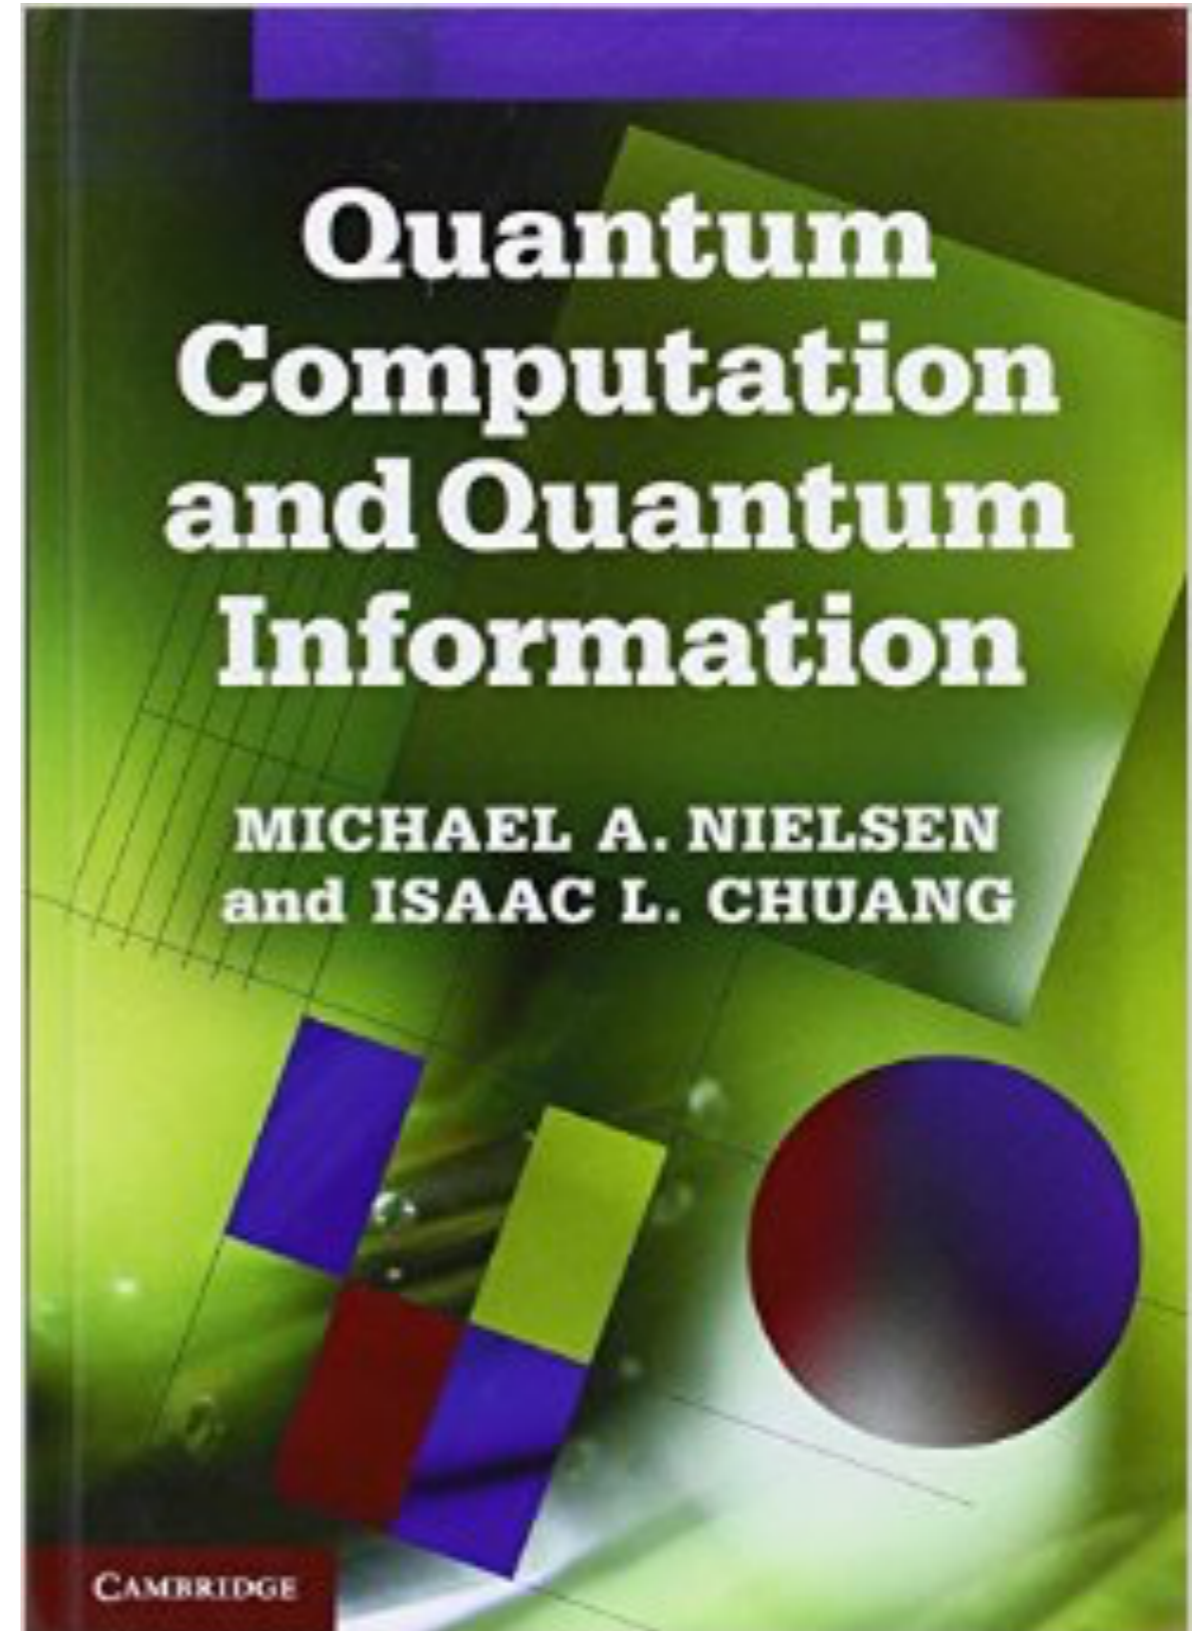

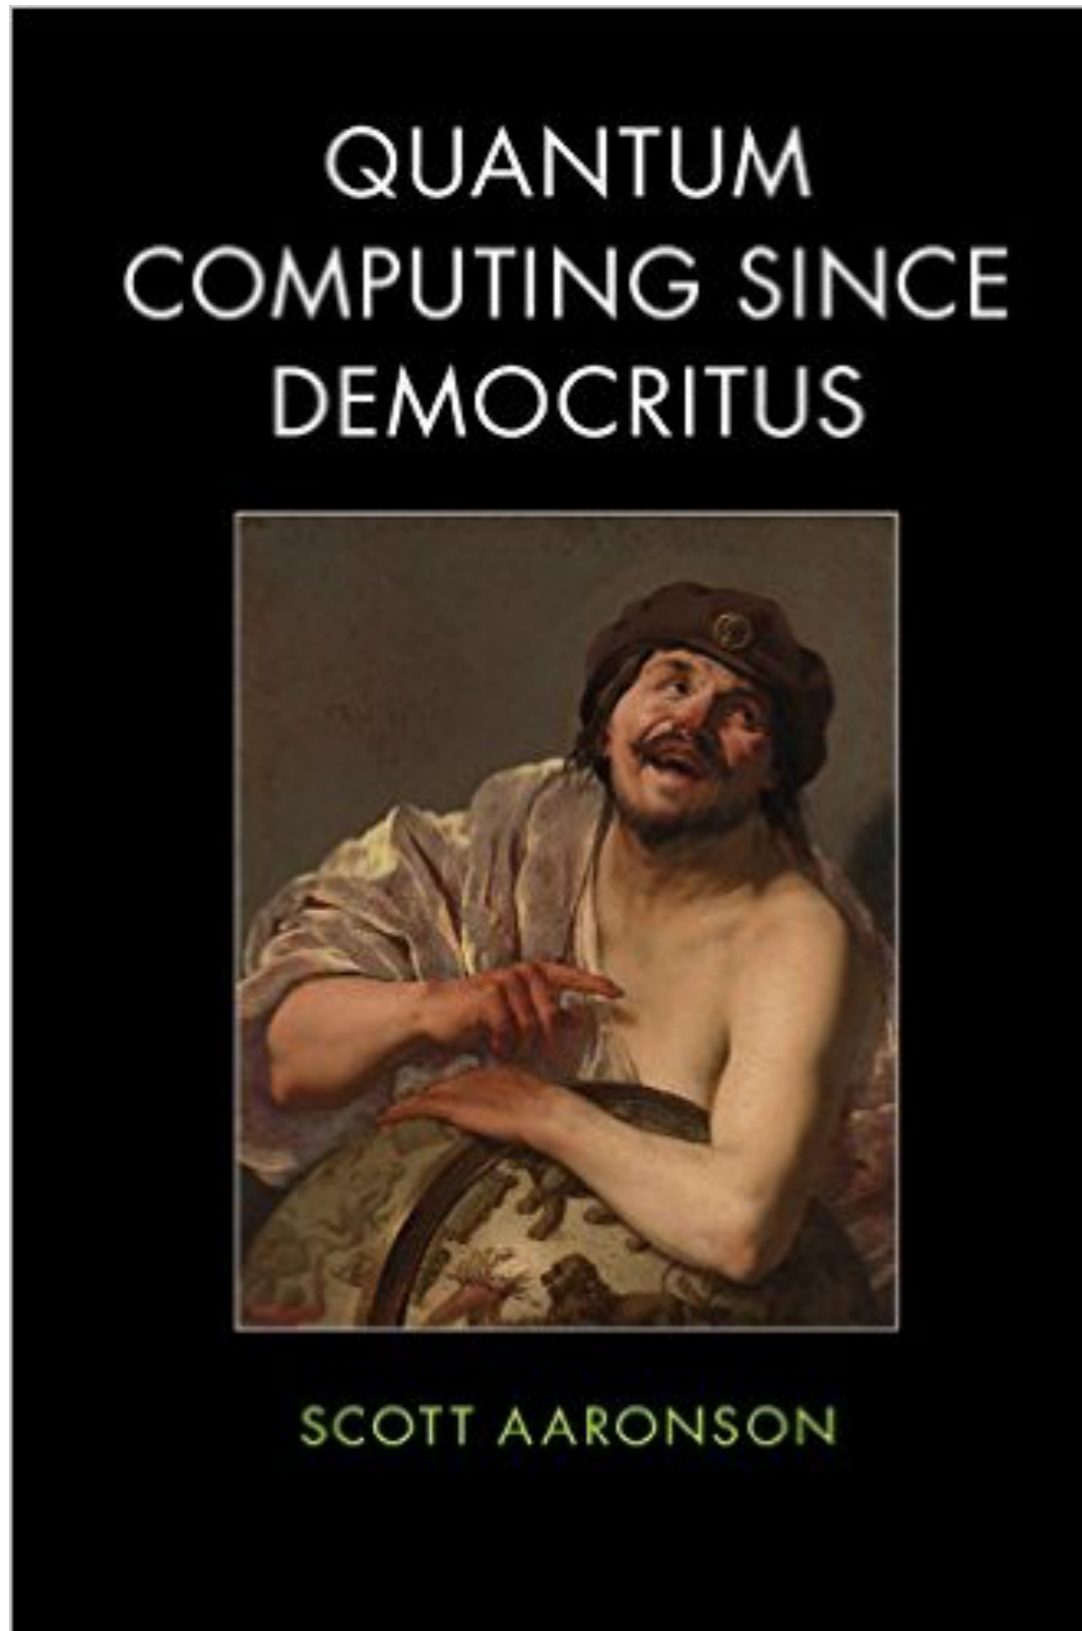

<https://roqnet.ro/about/>

## Dezvoltarea informatiei cuantice si a tehnologiilor cuantice in Romania

1. Metode teoretice si computationale pentru informatie cuantica
2. Dispozitive optice integrate pentru tehnologii cuantice fabricate prin litografie 3D
3. Informatie cuantica cu vortexuri optice
4. Laboratoare de cercetare pentru tehnologii cuantice
5. Calcul cuantic cu fermioni Majorana

# Recommended reading

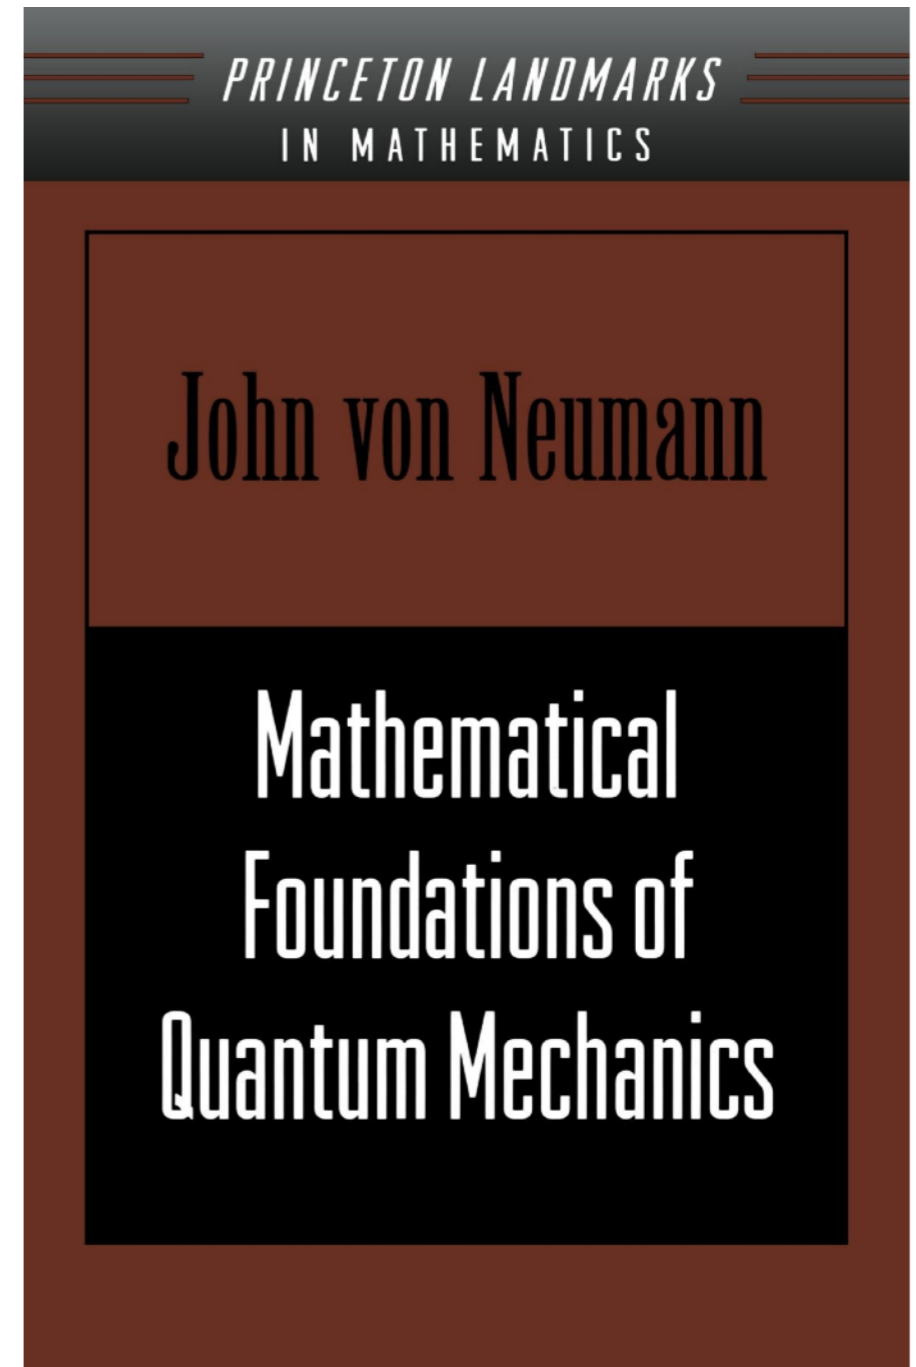

# Quantum mechanics

Inception of QM **1900-1932**

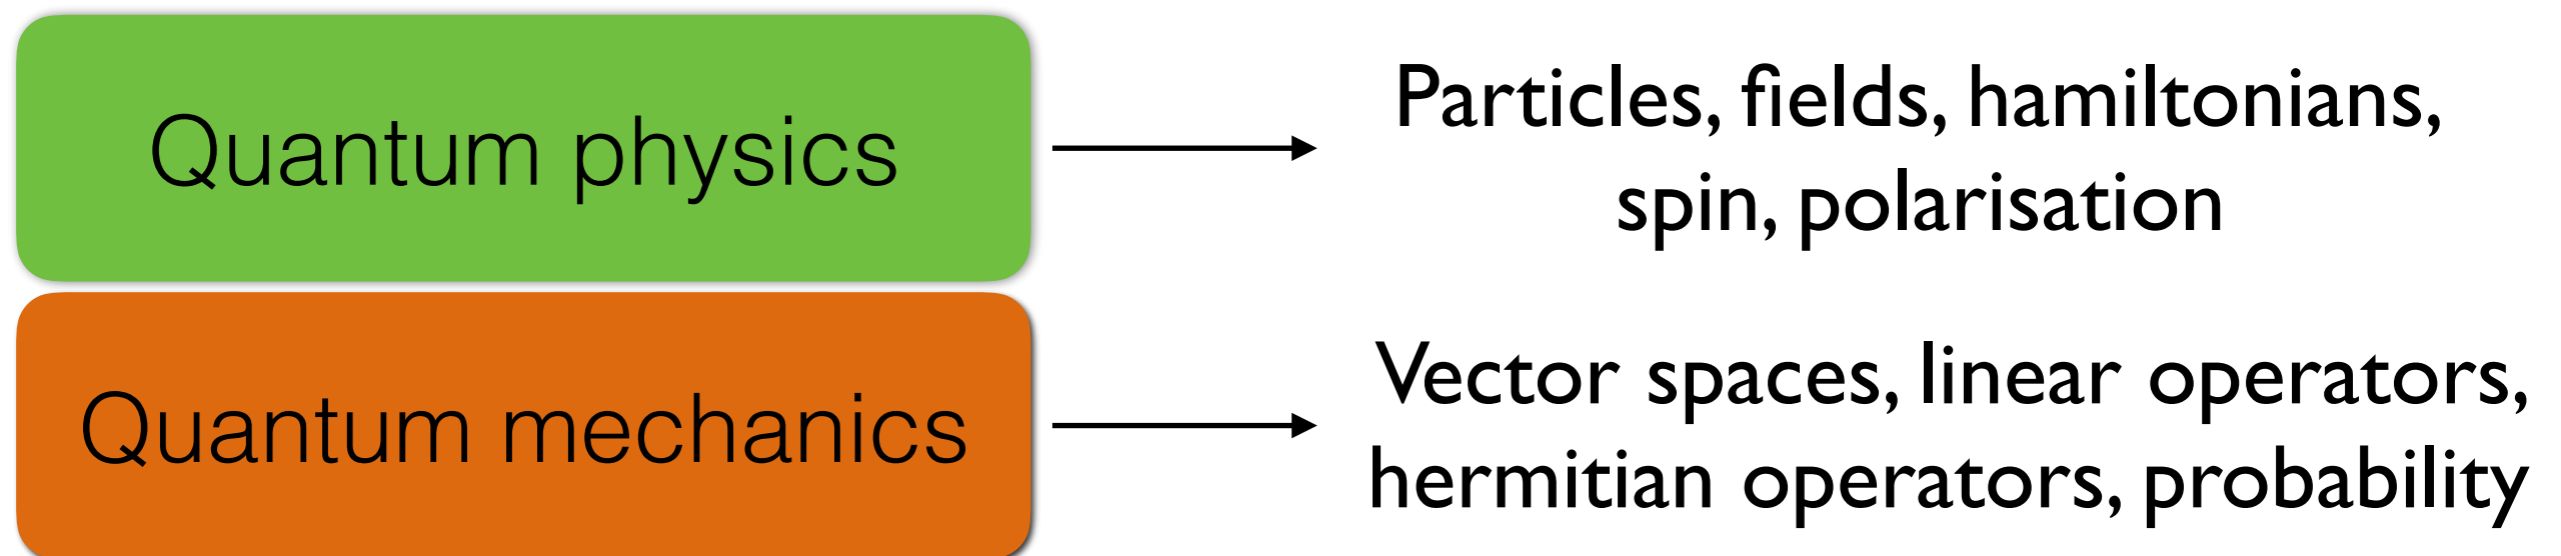

Solvay conference 1927

# Quantum mechanics

- Best model we have for small scales, high energies
- Semiconductors, lasers, NMR, superconductors etc
- Quantum mechanics is a **framework** for physics

*“Quantum mechanics is remarkably simple, once you take all the physics out of it”*  
**Scott Aaronson**

# Classical vs. quantum

Simulating physics with computers - **1981**

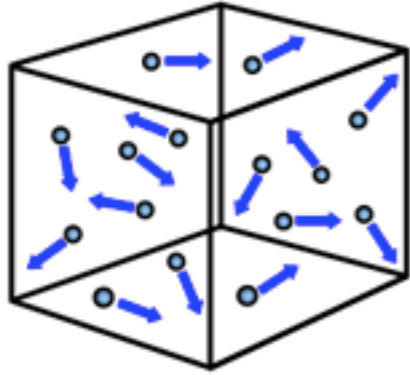

*“What kind of computer are we going to use to simulate physics?”*

Simulating quantum systems

# Classical vs. quantum

## Classical

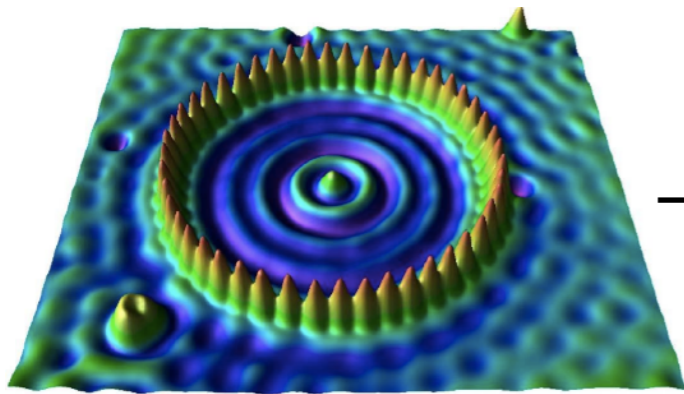

N particles

**State**

$$\begin{aligned} & (x_1, y_1, z_1), (x_2, y_2, z_2), \dots, (x_N, y_N, z_N) \\ & (p_{x_1}, p_{y_1}, p_{z_1}), (p_{x_2}, p_{y_2}, p_{z_2}), \dots, (p_{x_N}, p_{y_N}, p_{z_N}) \end{aligned}$$

$O(N)$  variables

## Quantum

N particles

**State**

$$|\psi\rangle = \begin{pmatrix} \psi_0 \\ \psi_1 \\ \psi_2 \\ \dots \\ \psi_{2^{O(N)}} \end{pmatrix}$$

$2^{O(N)}$   
variables

# Classical vs. quantum

## Simulating physics with computers - **1981**

*“What kind of computer are we going to use to simulate physics?”*

Simulating quantum systems

Inefficient classically

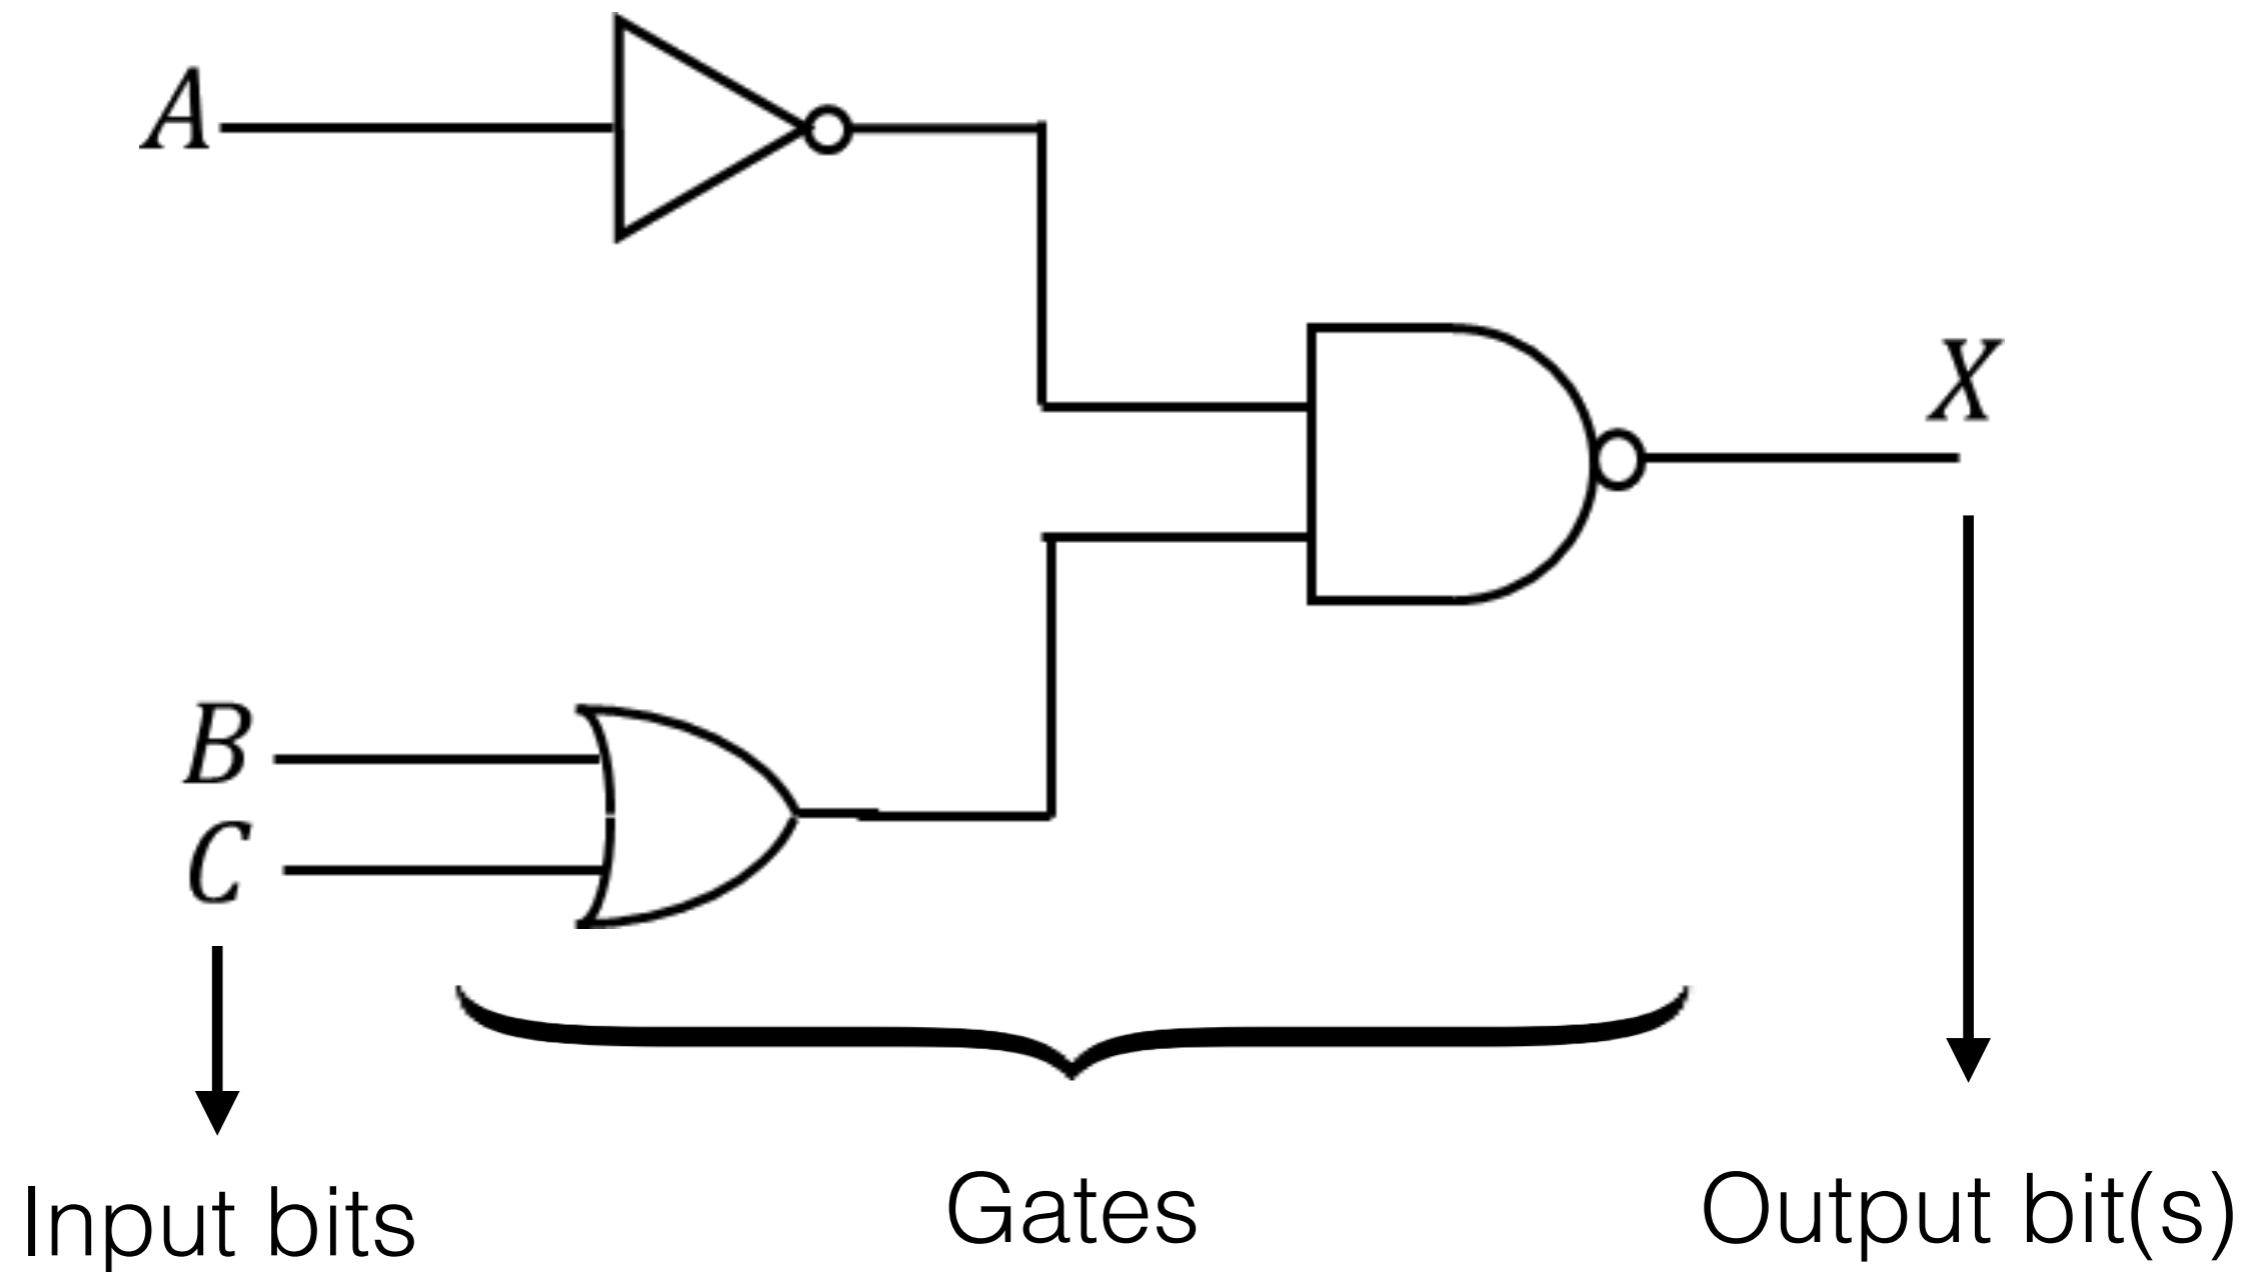

*“Can you do it with a new kind of computer - a quantum computer?”*

*“I believe that with a suitable class of quantum machines you could imitate any quantum system, including the physical world”*

# A brief history of quantum computing

- **1980s** - Idea of quantum computation. Benioff, Manin, Feynman, Deutsch.
- **1990s** - Theory of efficient quantum simulation. Lloyd.
- **1994** - Efficient quantum algorithm for factoring and discrete log (breaking RSA, Diffie-Hellman, ECC, etc). Shor.
- **2000s** - Many small scale experiments; quantum complexity theory; quantum machine learning.
- **2010s** - Quantum supremacy? Small scale devices (IBM, Rigetti, Google).

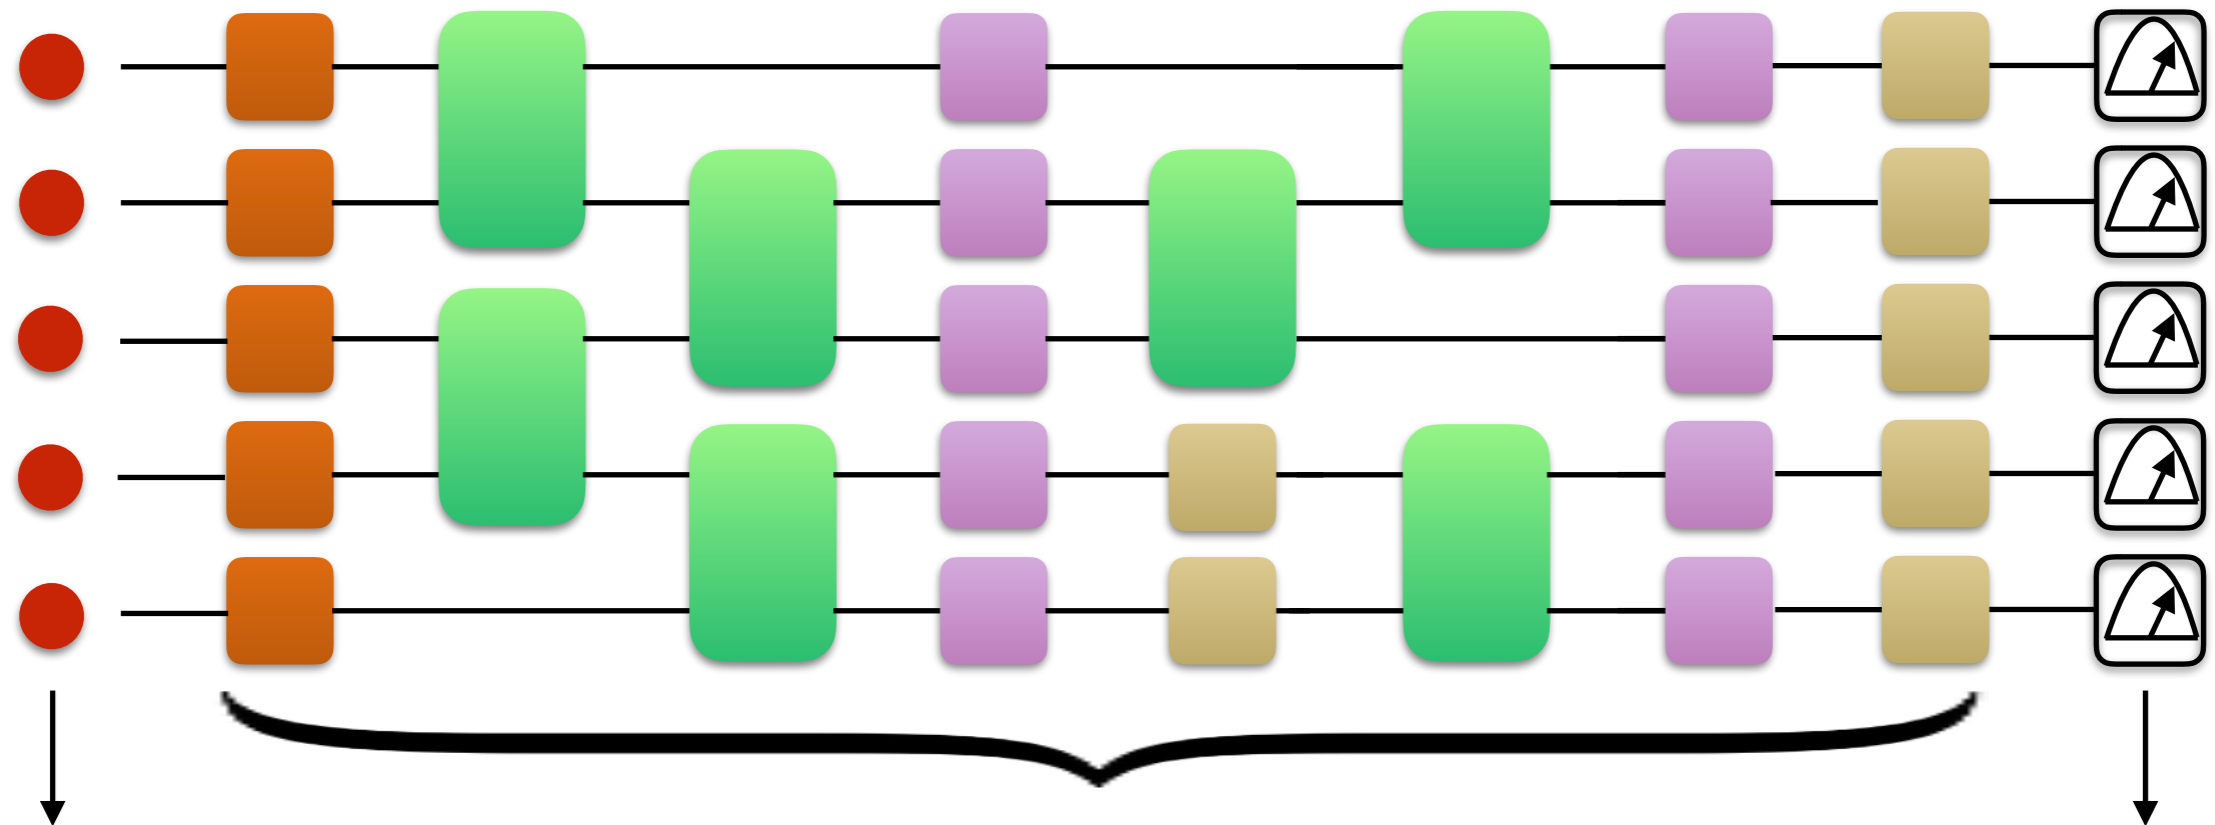

# *A new kind of computer...*

$$X = NAND(OR(B, C), NOT(A))$$

Boolean functions

# *A new kind of computer...*

Qubits

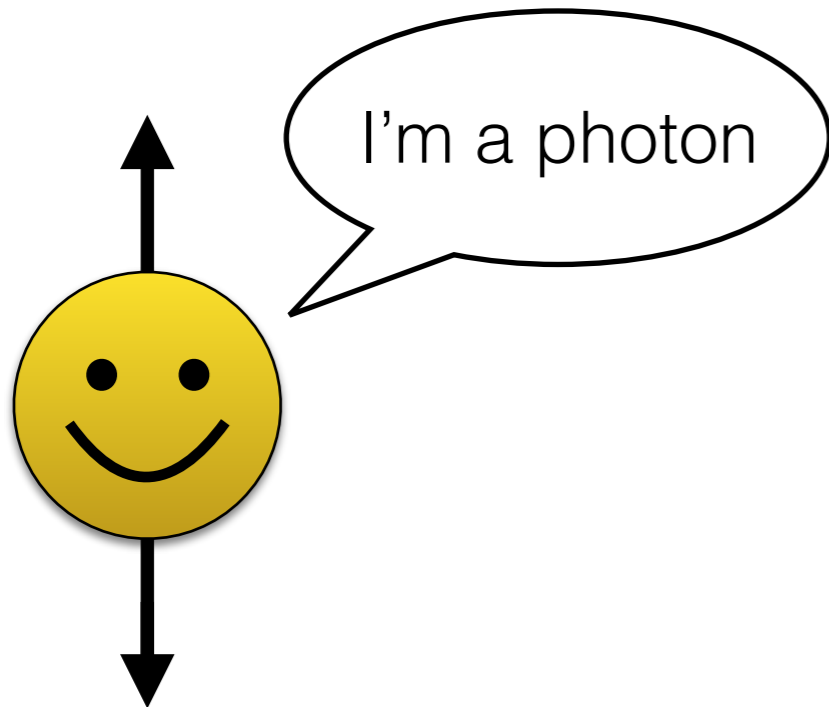

Quantum gates

Measurement

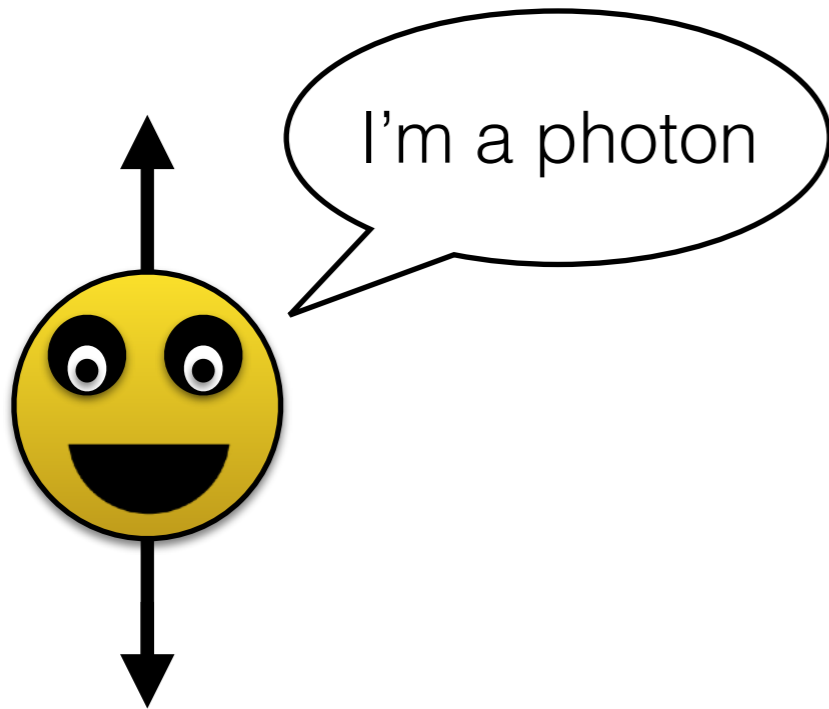

$$\begin{pmatrix} \psi_0 \\ \psi_1 \\ \vdots \\ \psi_{2^N-1} \end{pmatrix} \begin{pmatrix} \mathcal{C}_{0,0} & \cdots & \mathcal{C}_{0,2^N-1} \\ \mathcal{C}_{1,0} & \cdots & \mathcal{C}_{1,2^N-1} \\ \vdots & & \vdots \\ \mathcal{C}_{2^N-1,0} & \cdots & \mathcal{C}_{2^N-1,2^N-1} \end{pmatrix} \begin{pmatrix} |\phi_0|^2 \rightarrow 00\dots 0 \\ |\phi_1|^2 \rightarrow 00\dots 1 \\ \vdots \\ |\phi_{2^N-1}|^2 \rightarrow 11\dots 1 \end{pmatrix}$$

$|\psi\rangle$ 
 $|\phi\rangle = \mathcal{C}|\psi\rangle$ 
 $|\phi\rangle \rightarrow b_1 b_2 \dots b_N$

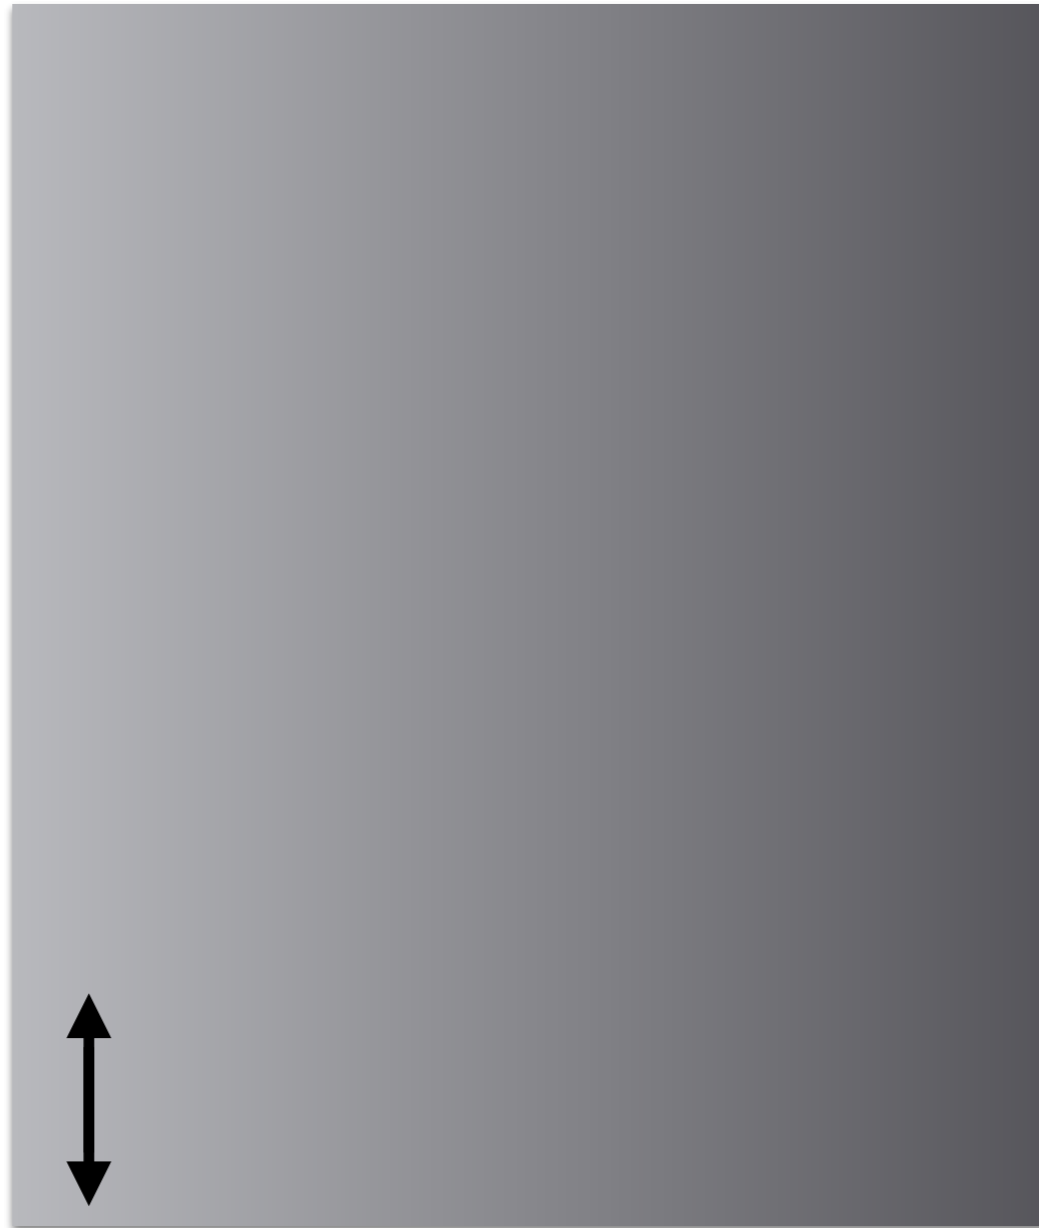

# Example with polarisation

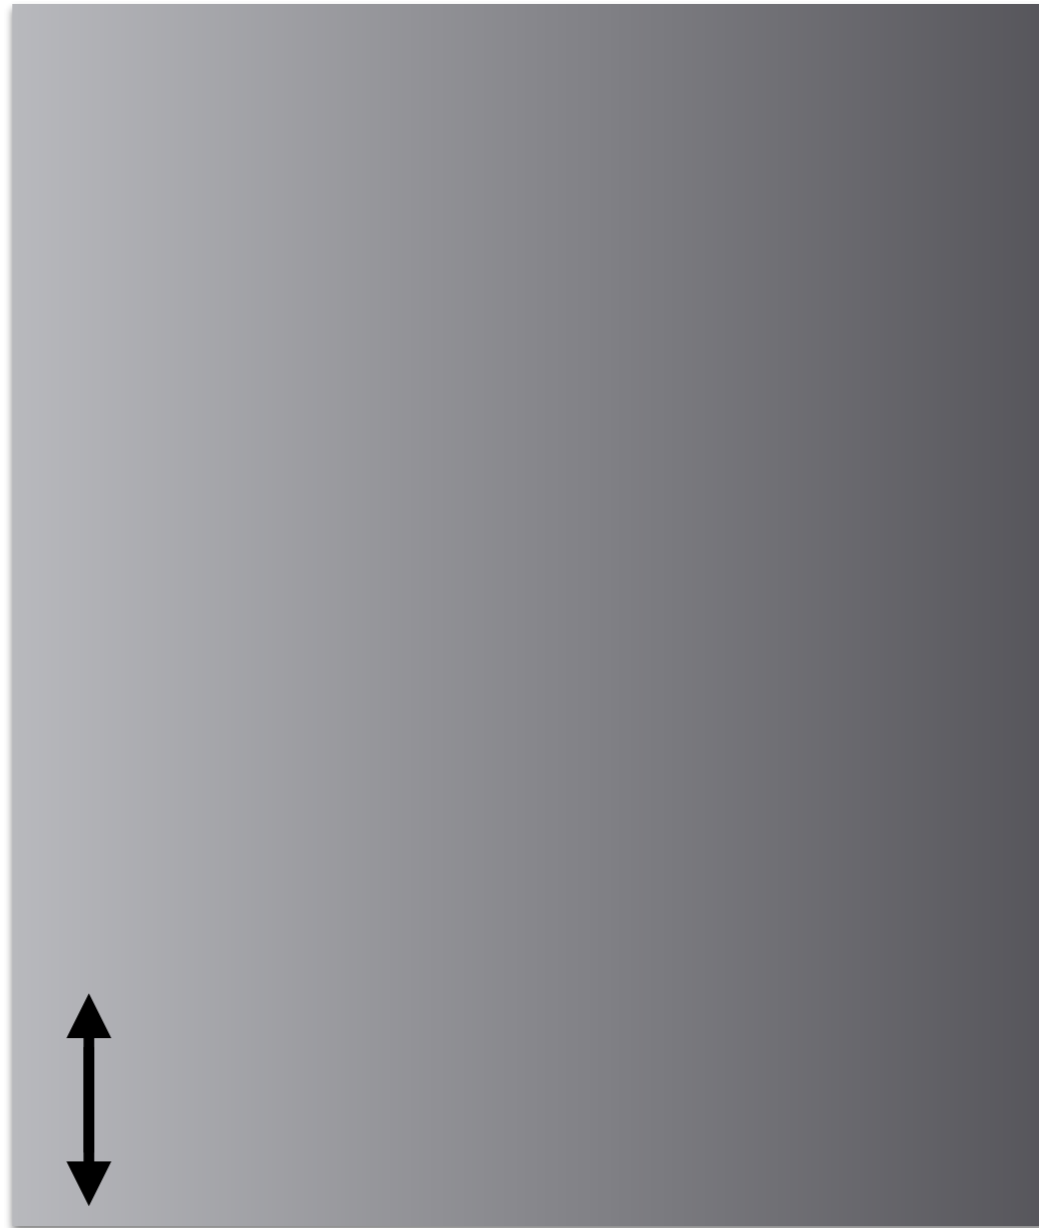

# Example with polarisation

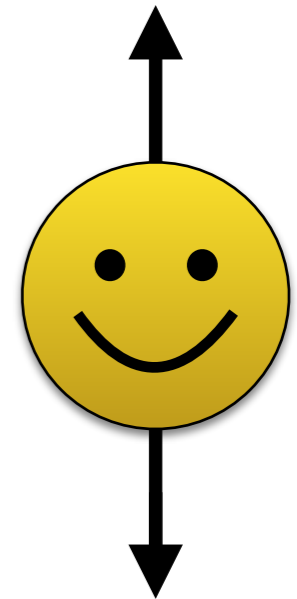

# Example with polarisation

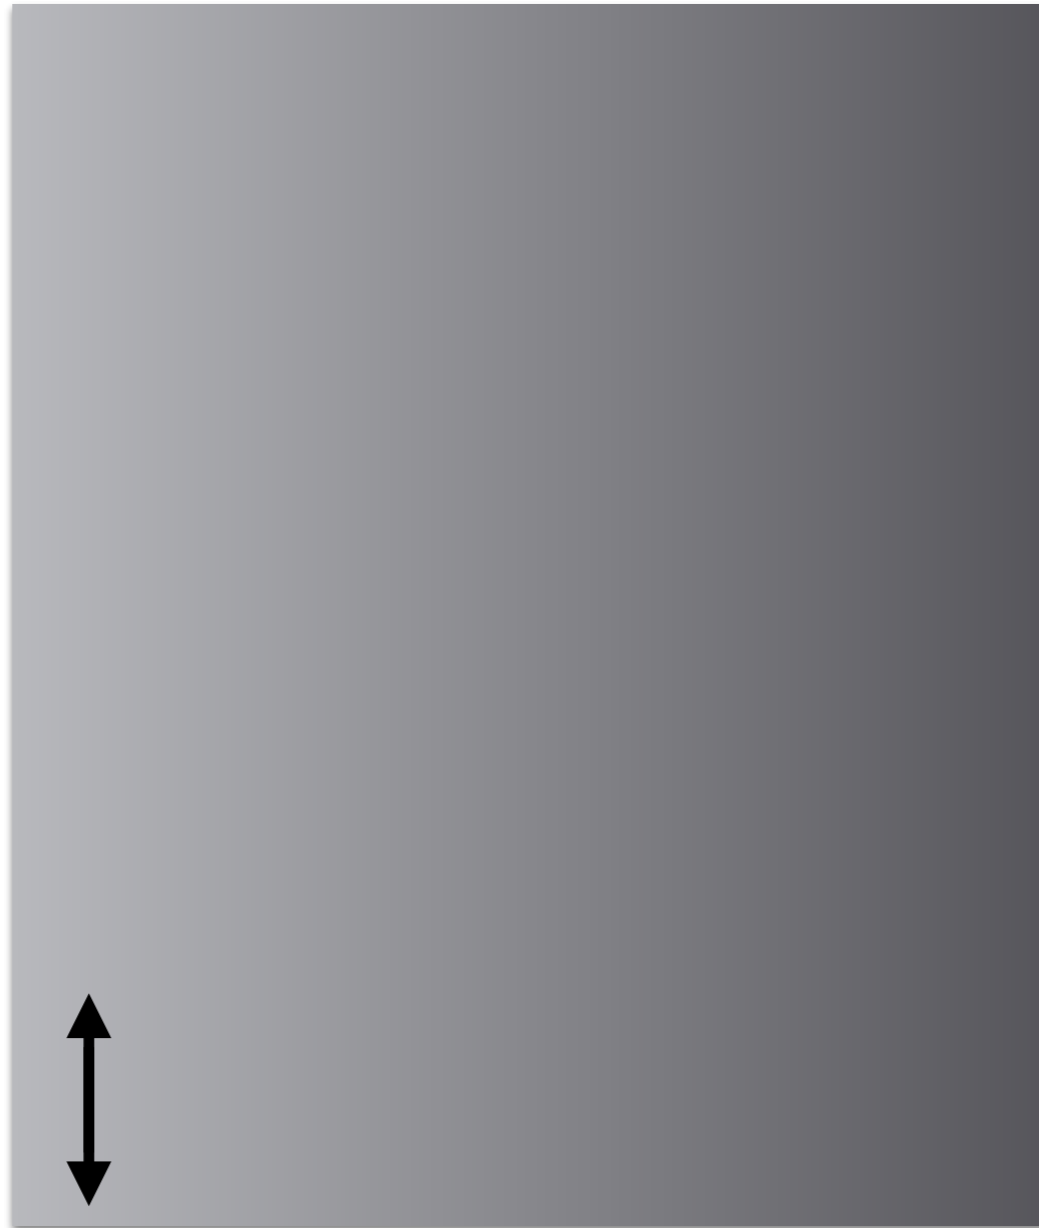

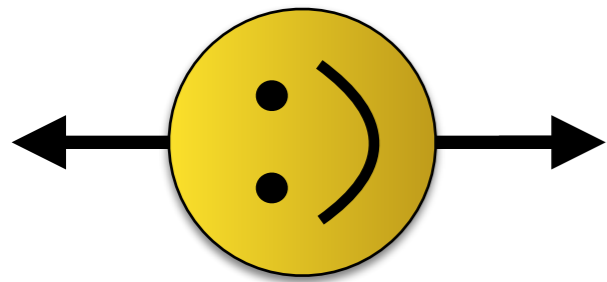

# Example with polarisation

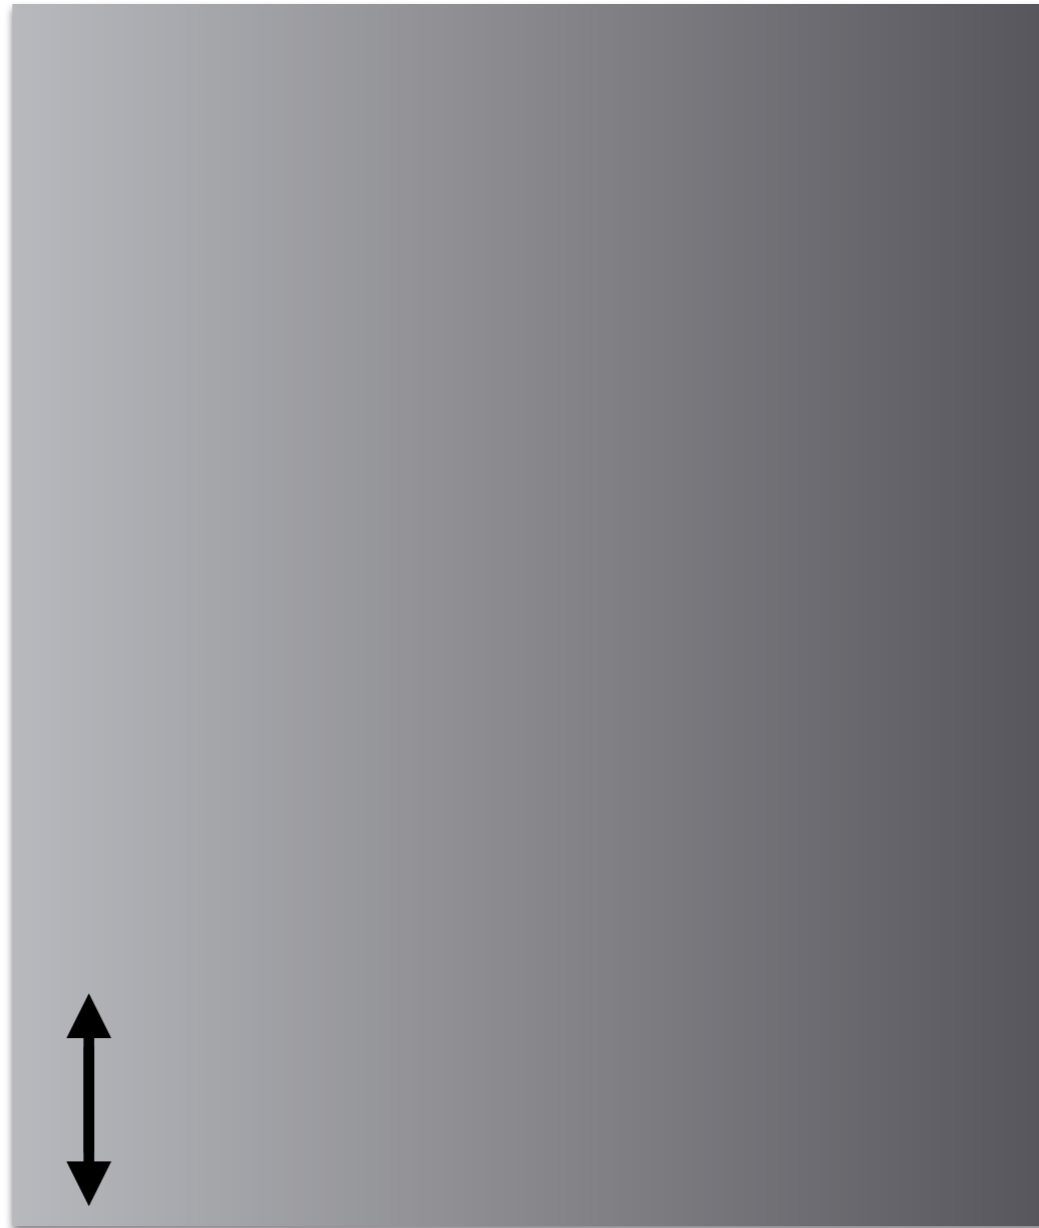

Passes

# Example with polarisation

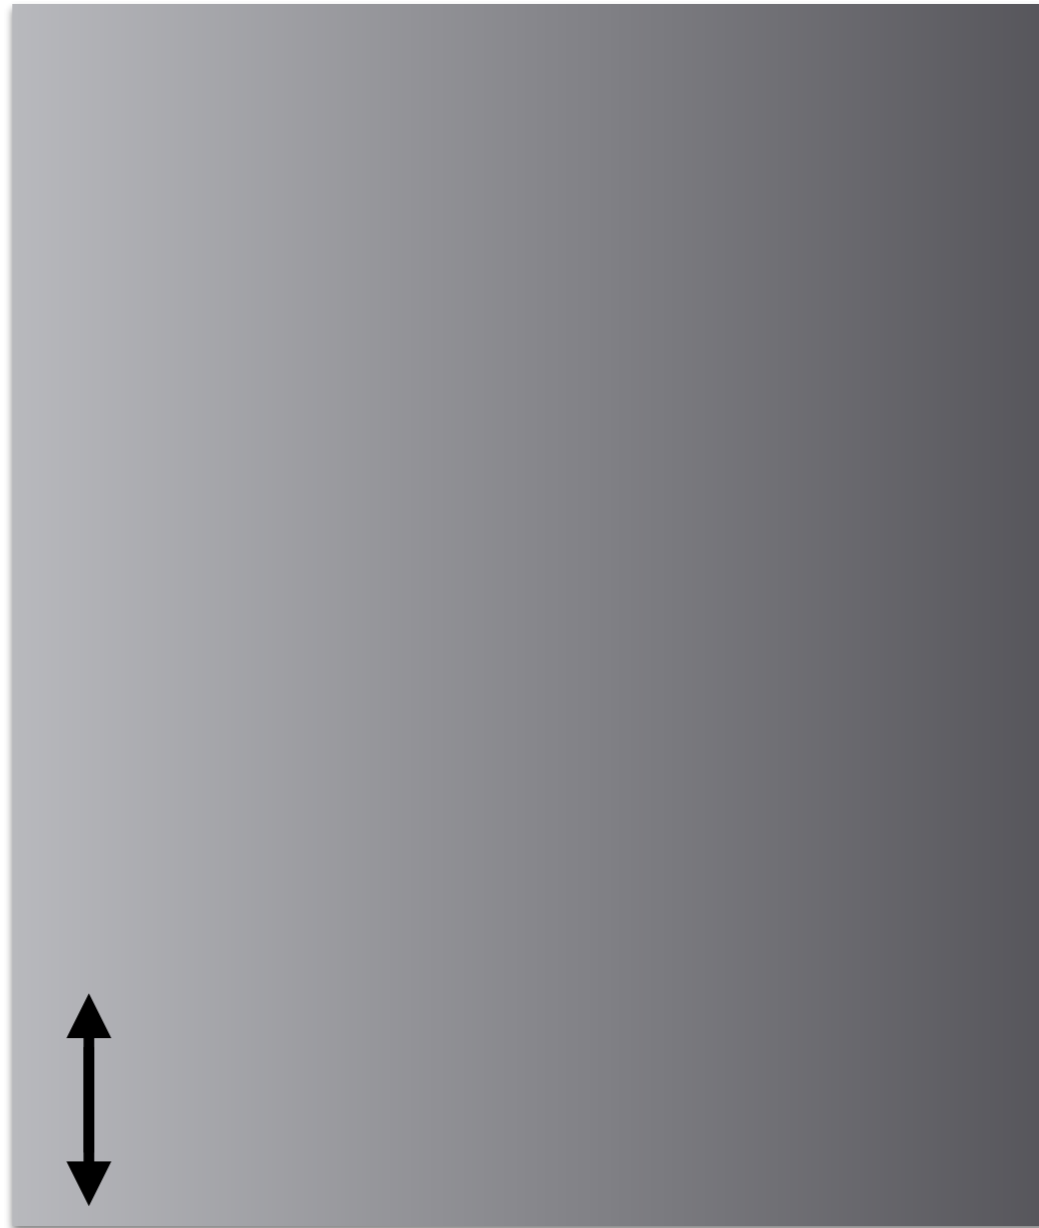

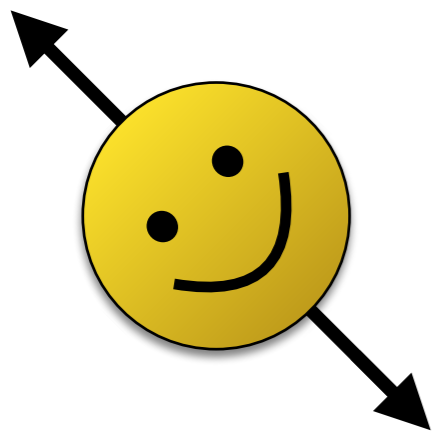

# Example with polarisation

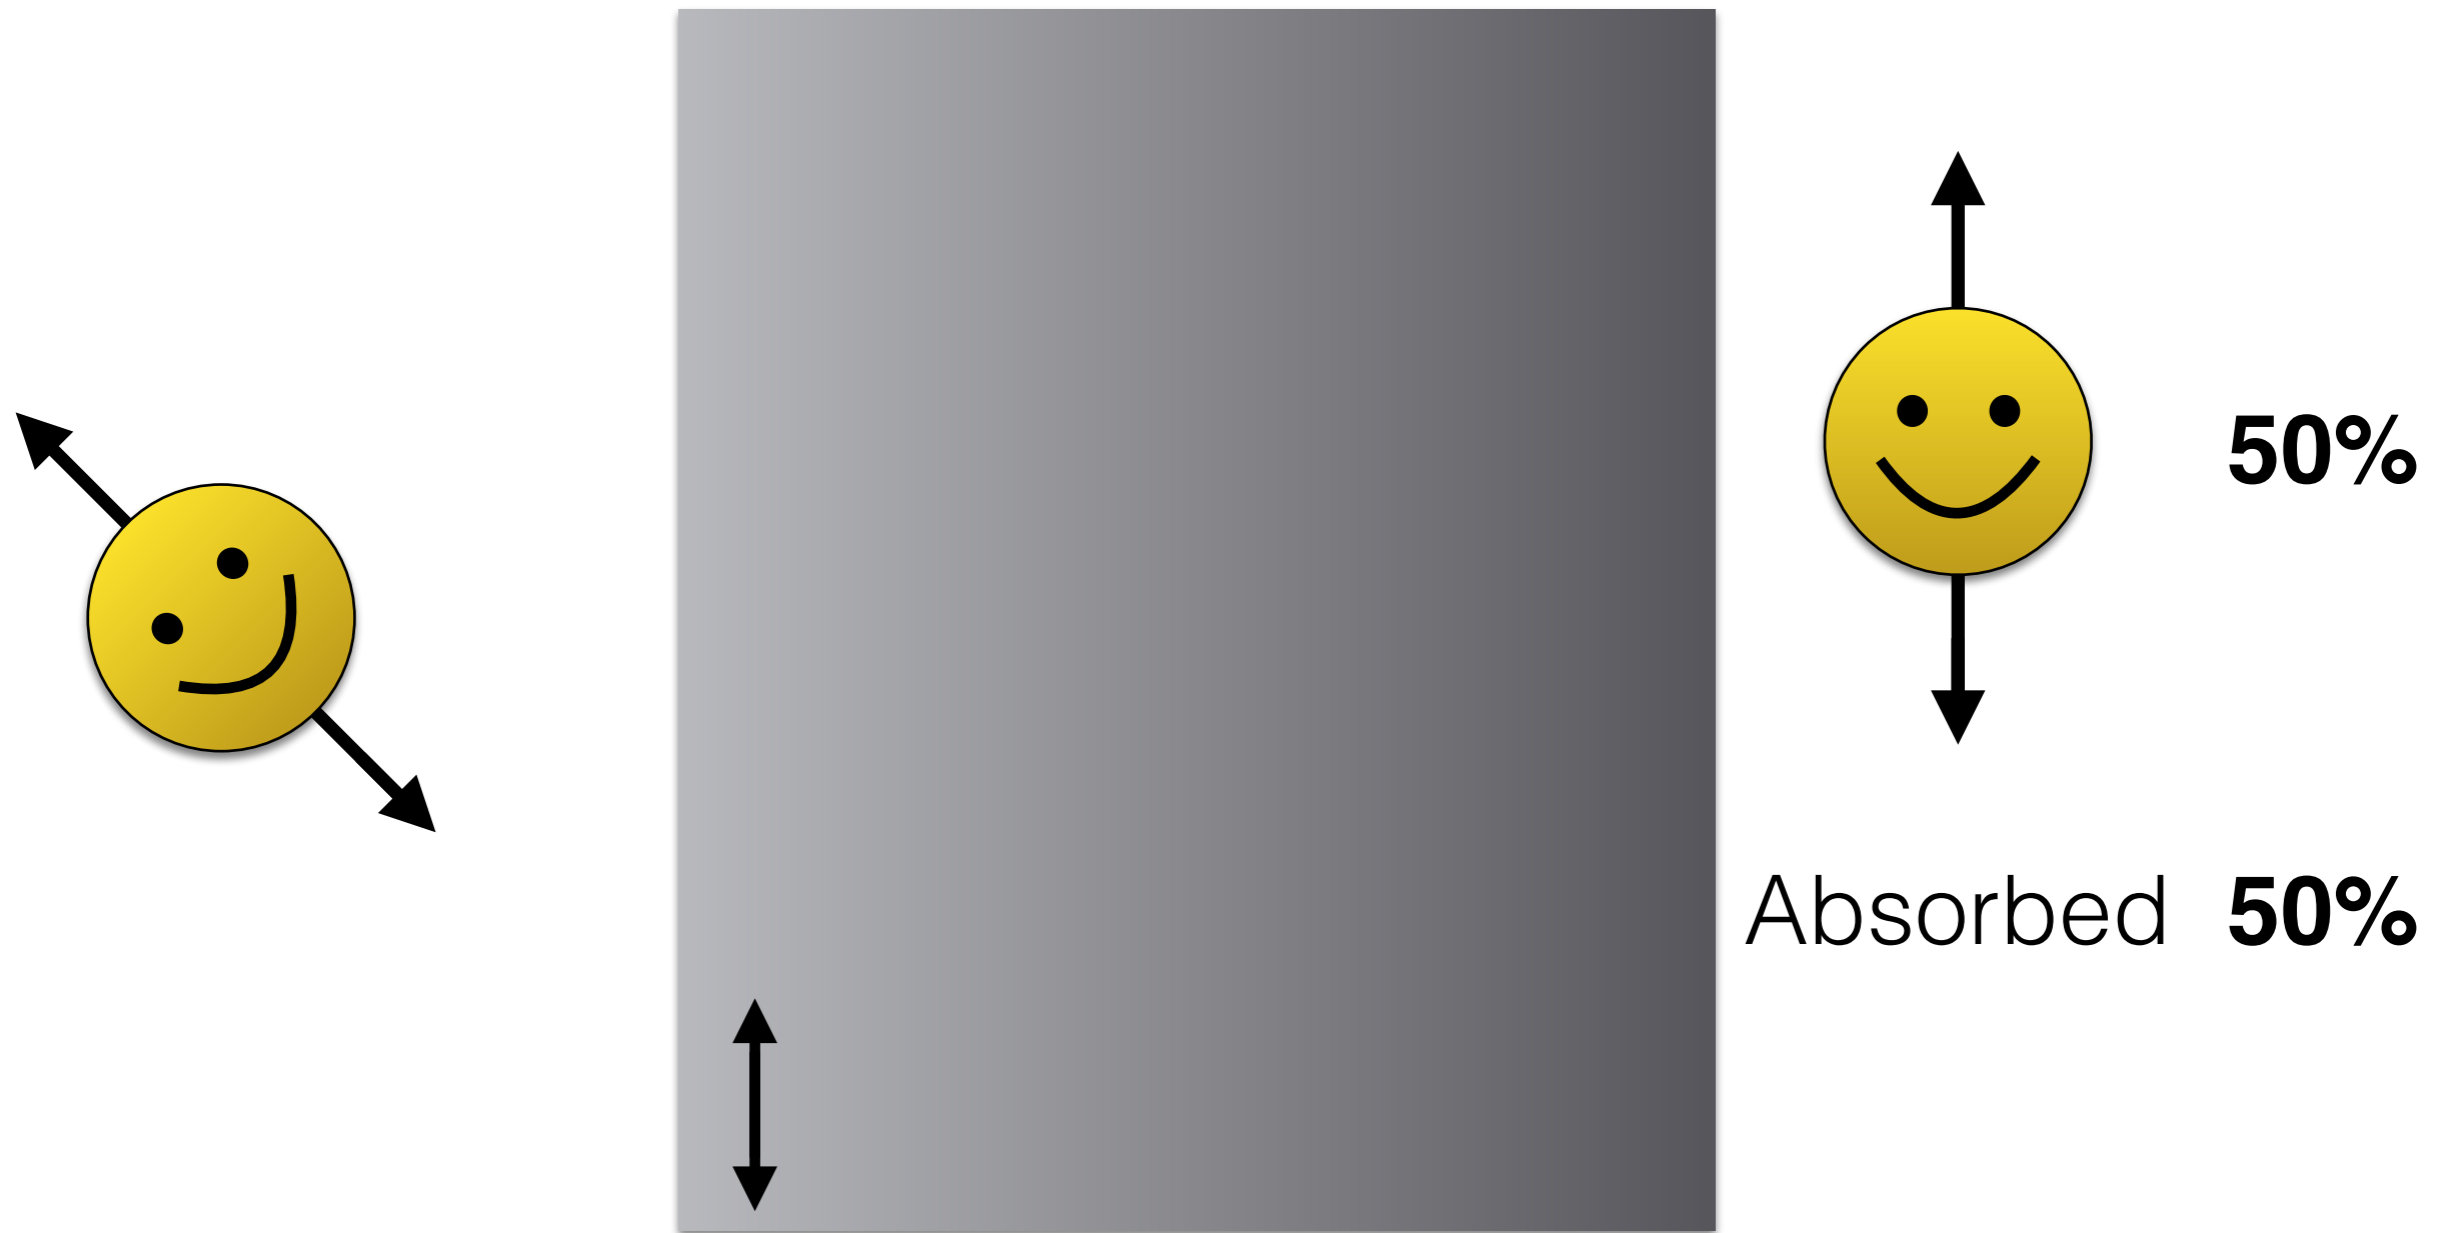

Absorbed

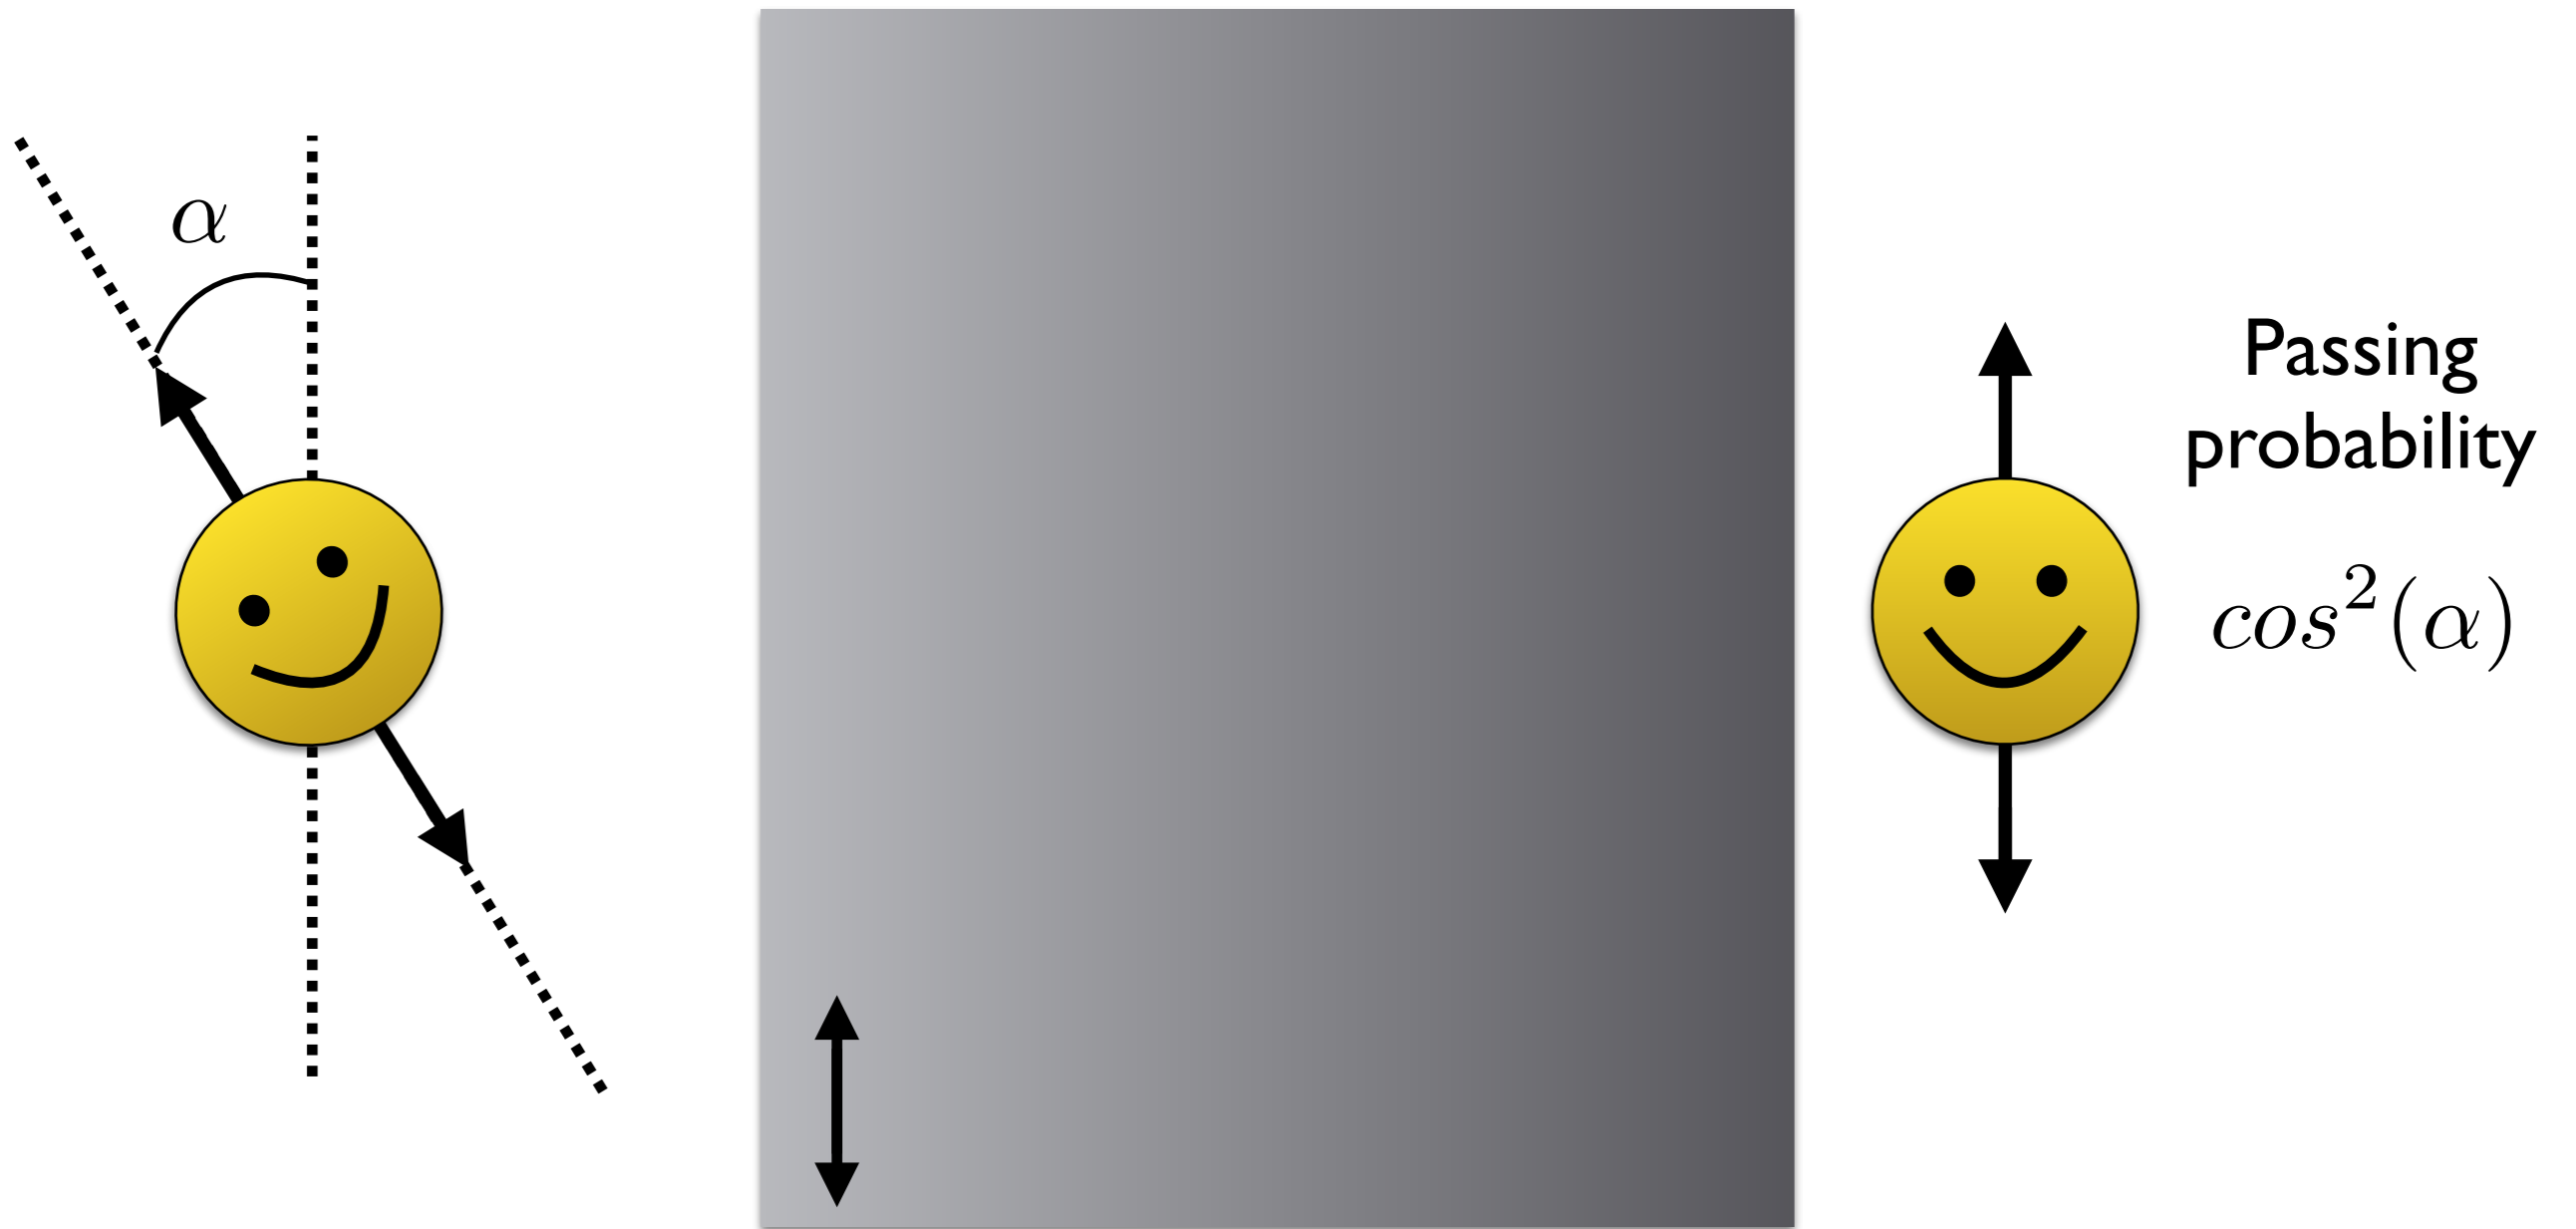

# Example with polarisation

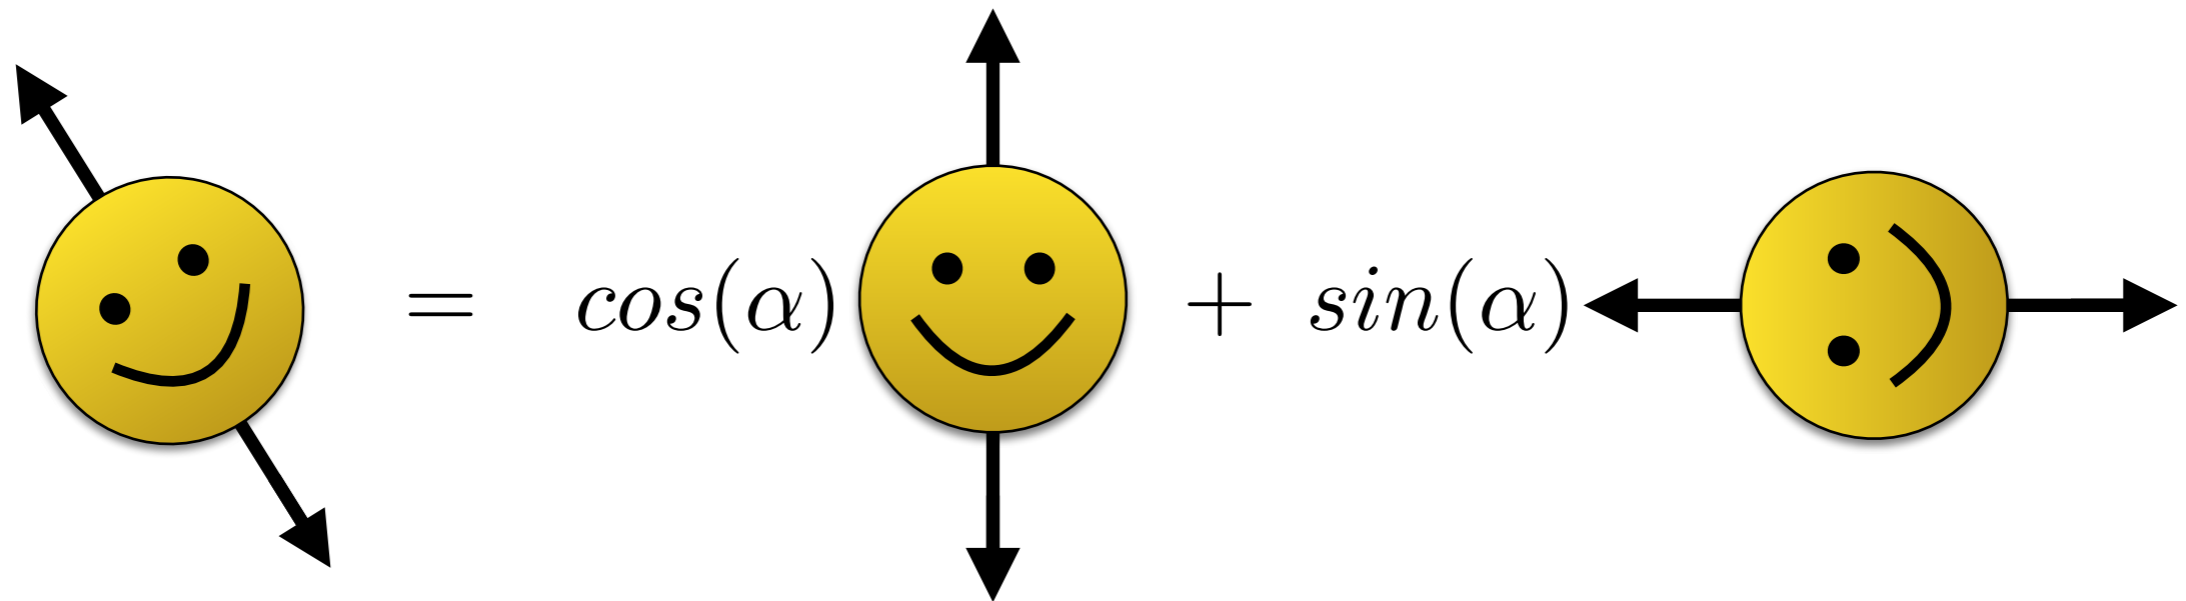

# Example with polarisation

# Example with polarisation

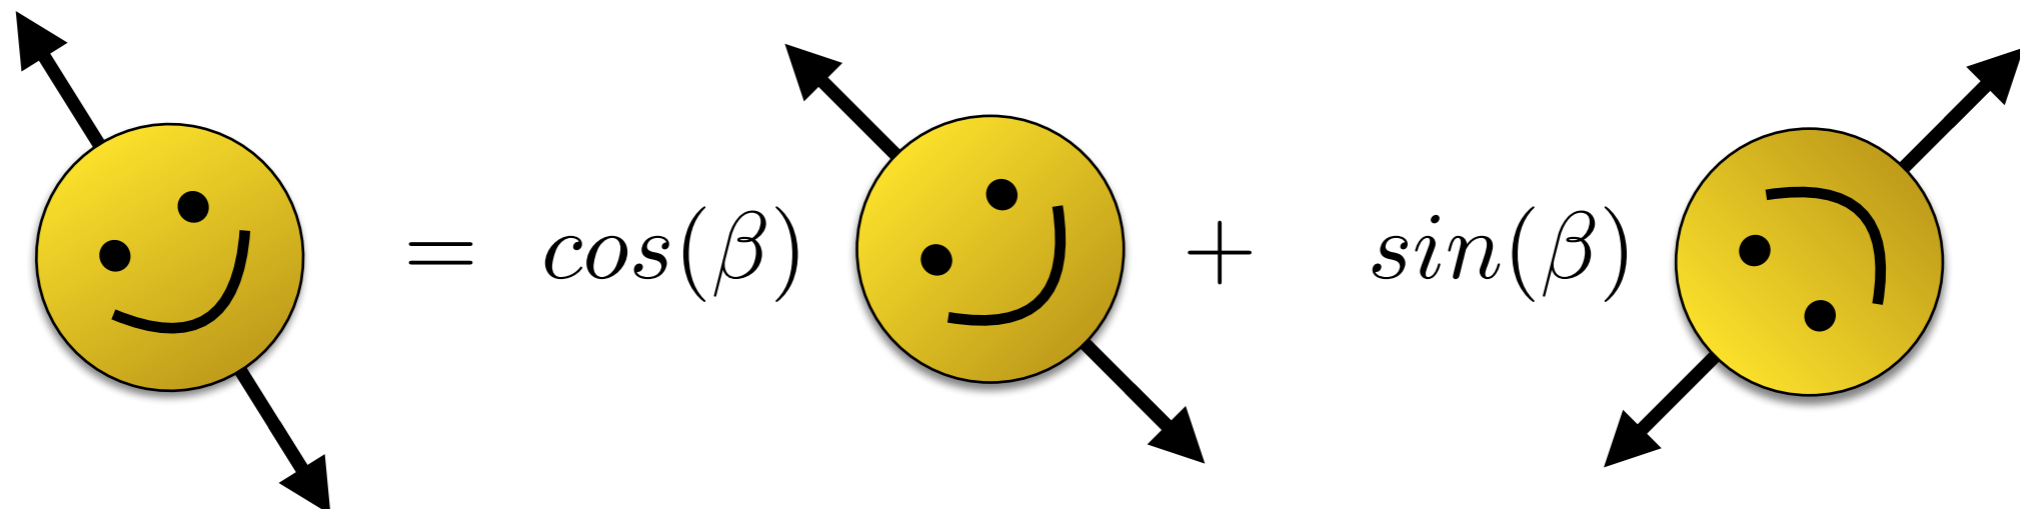

# Example with polarisation

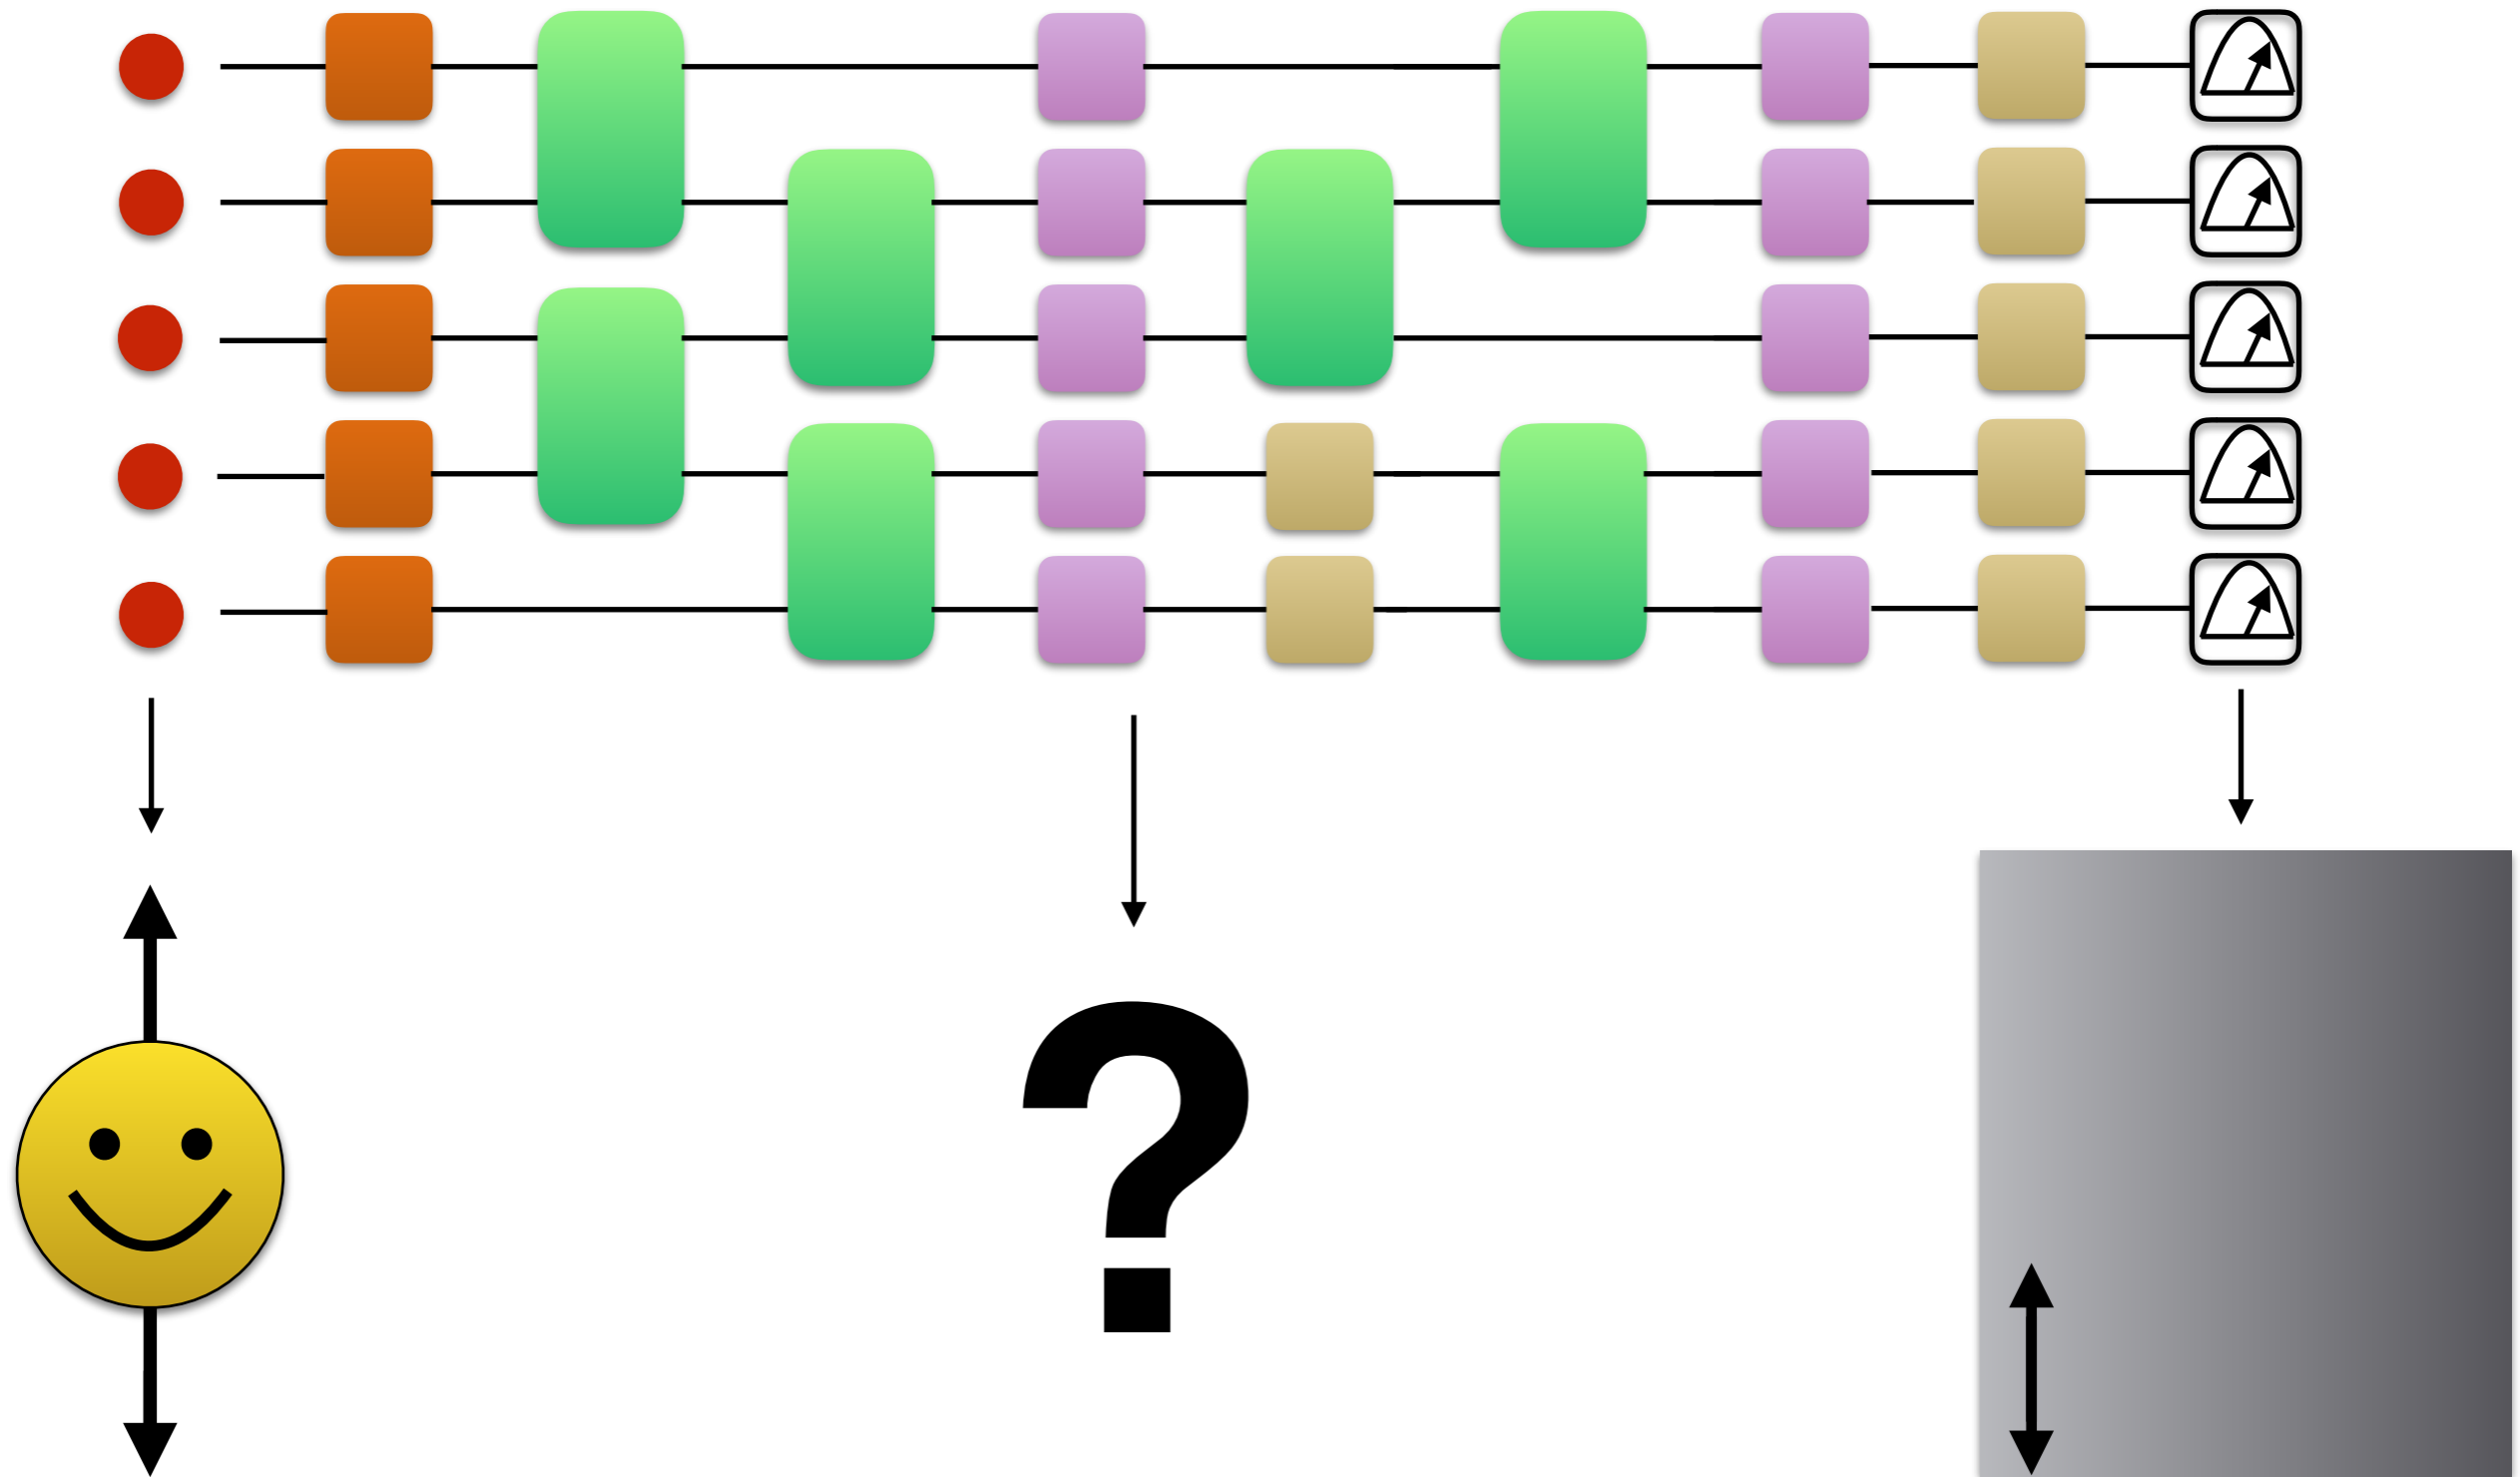

$$|\psi\rangle = \cos(\alpha)|0\rangle + \sin(\alpha)|1\rangle$$

## Superposition

Can choose a different basis

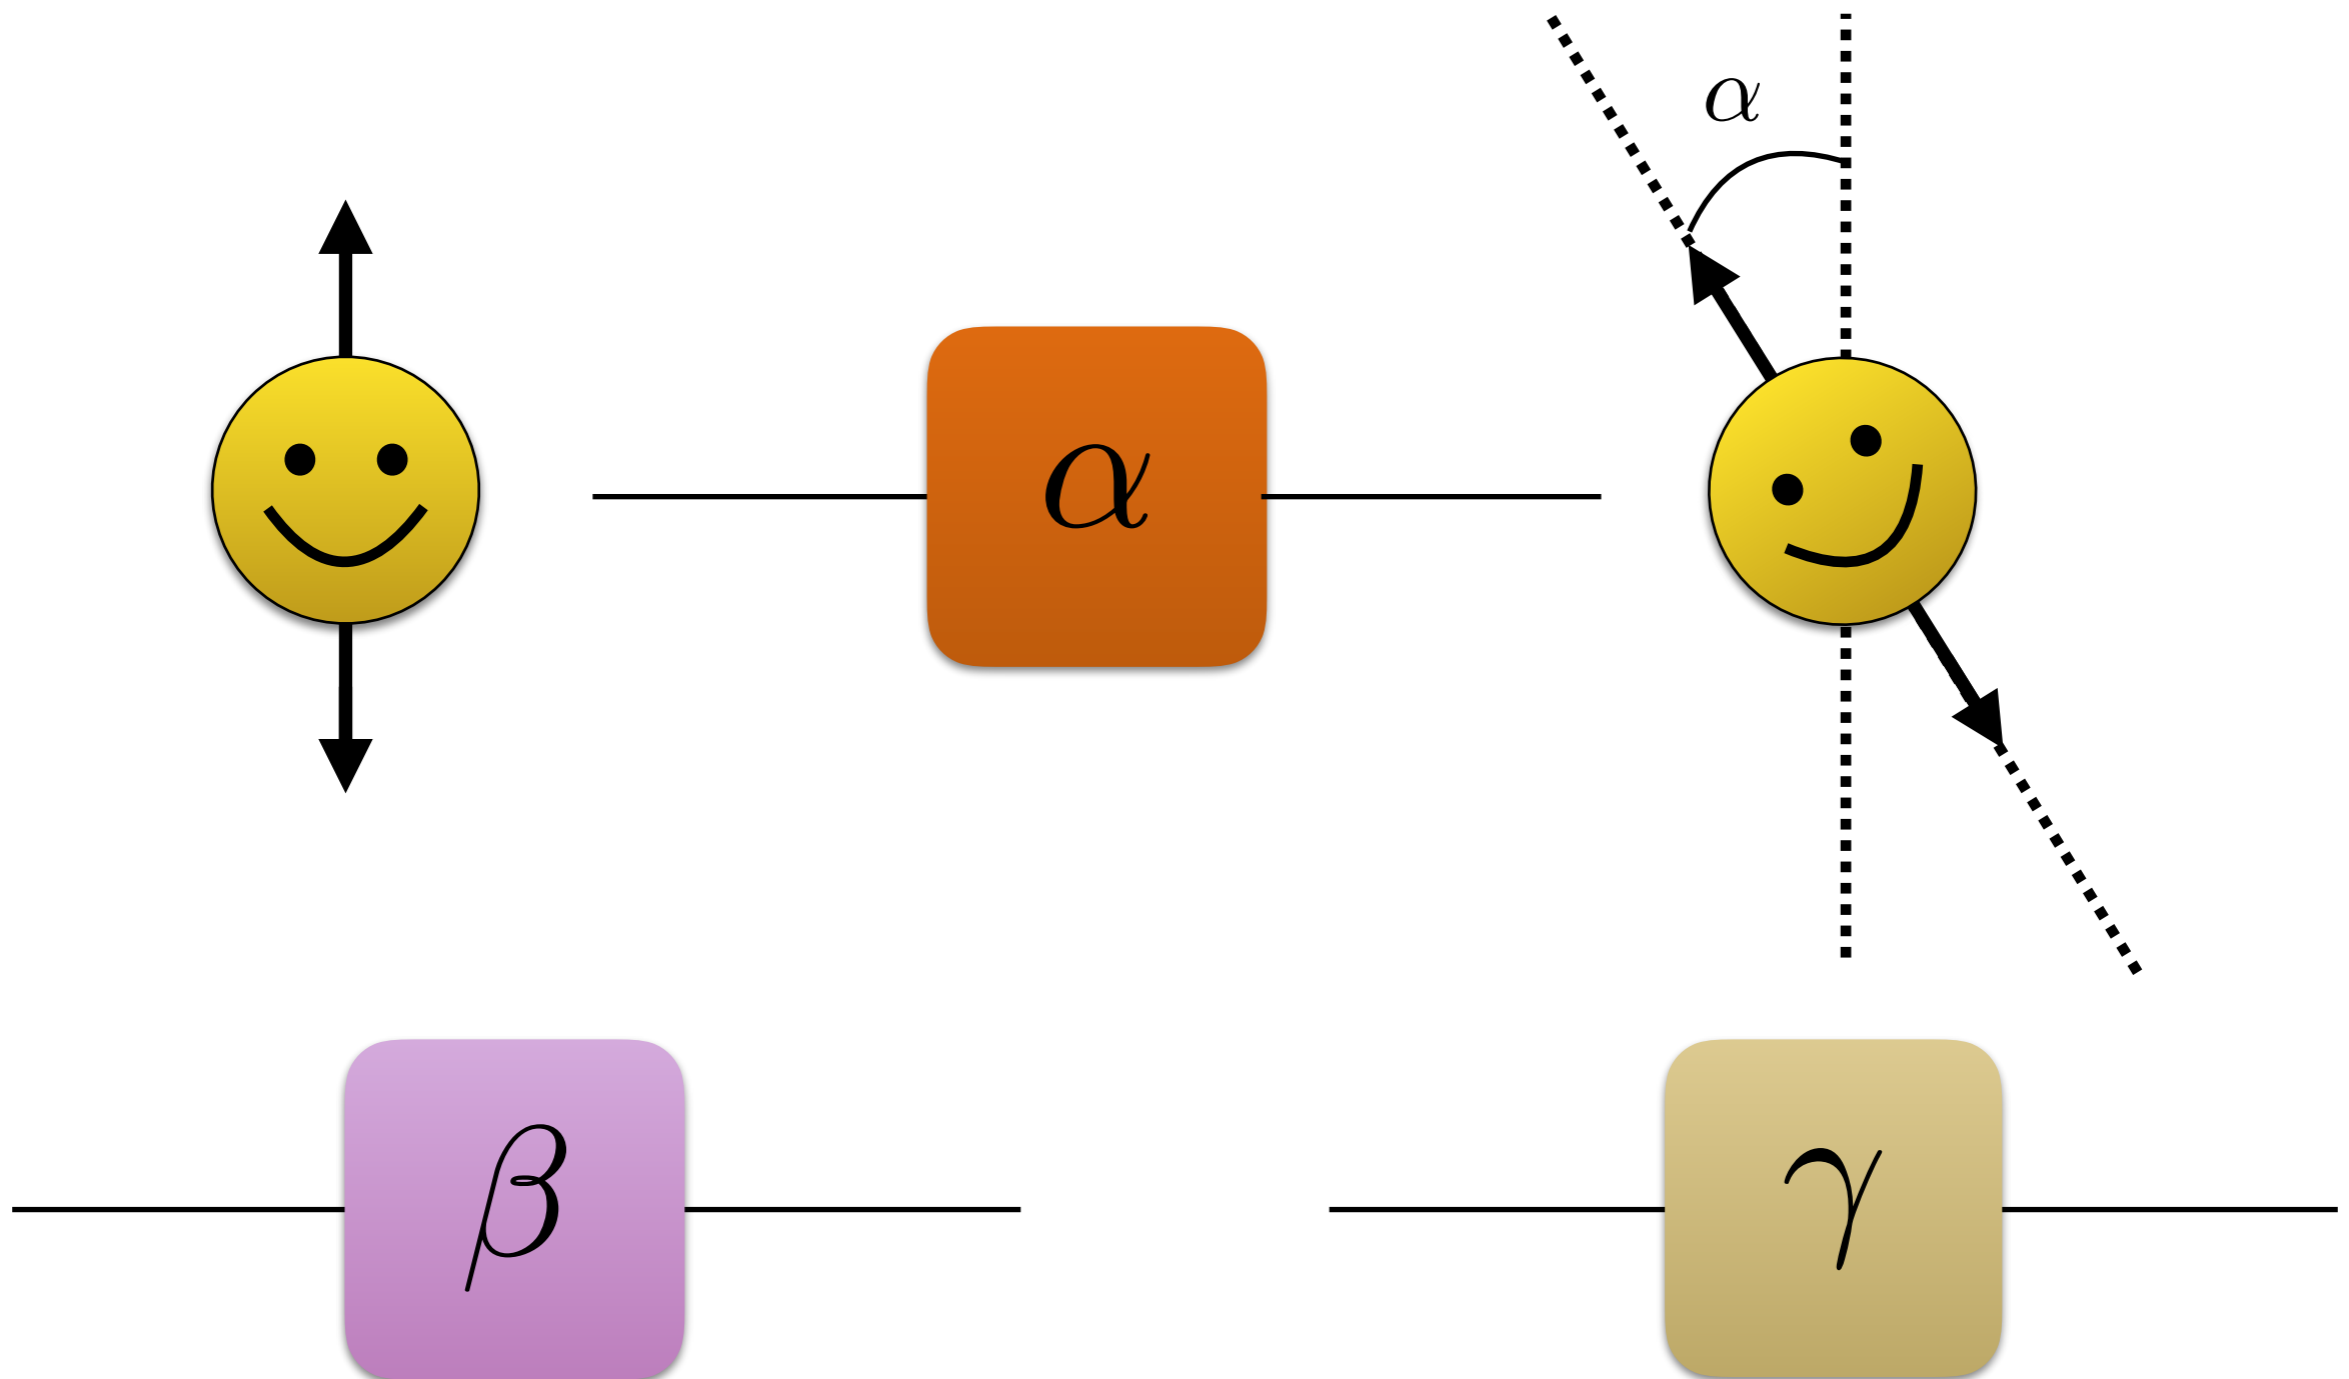

# Example with polarisation

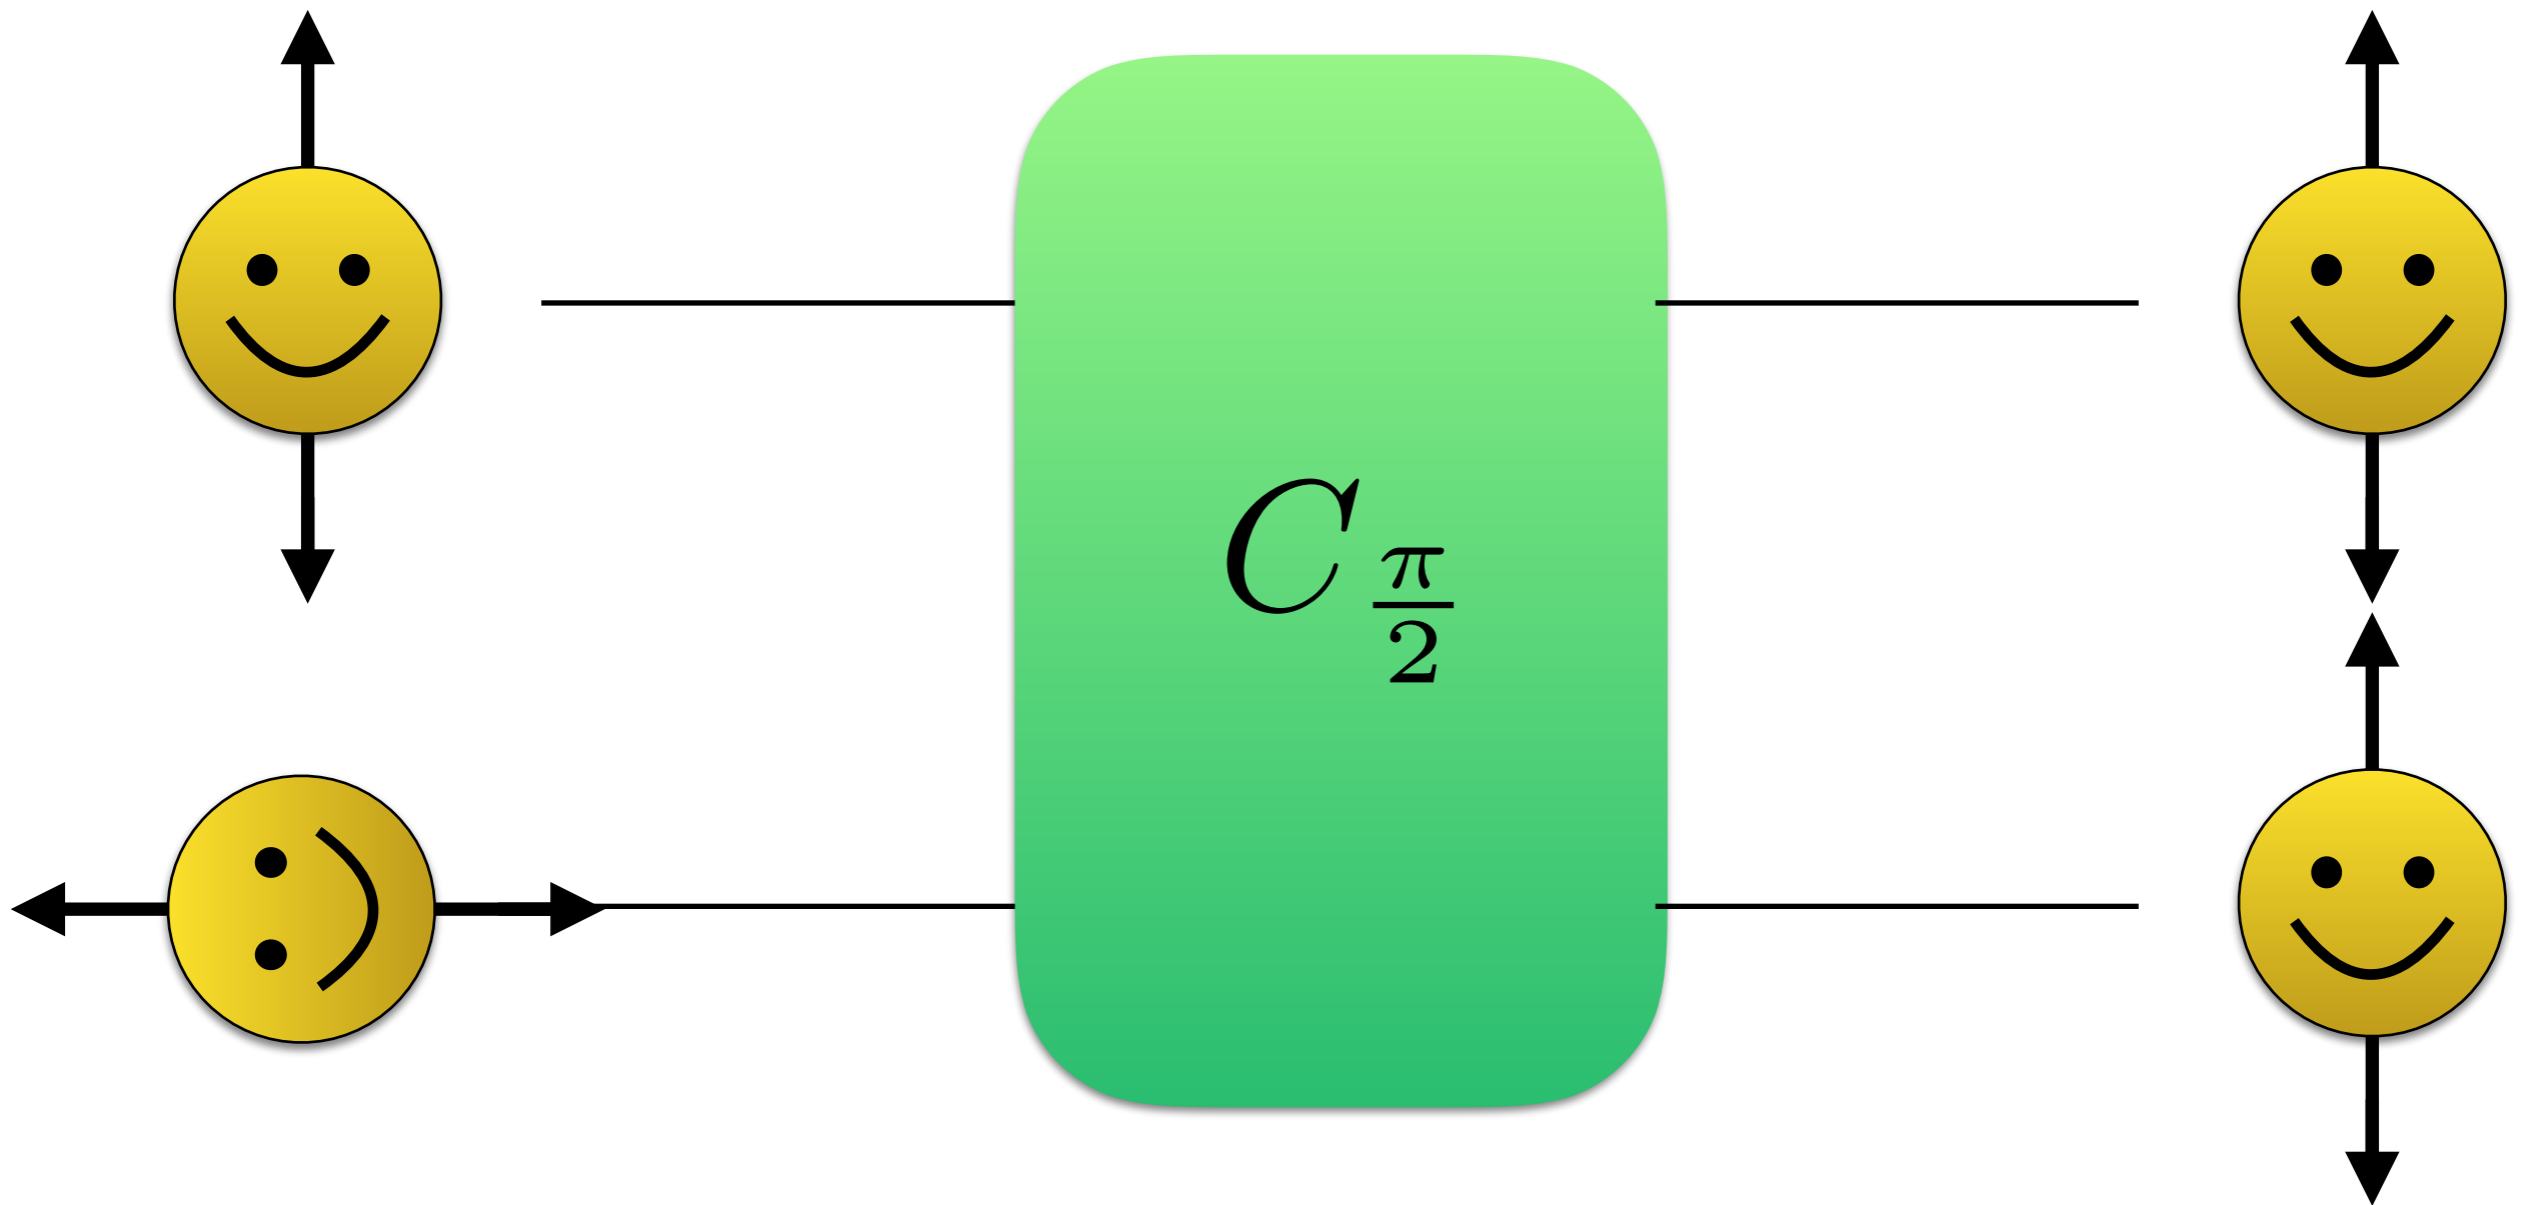

# Example with polarisation

Single-qubit gates perform rotations

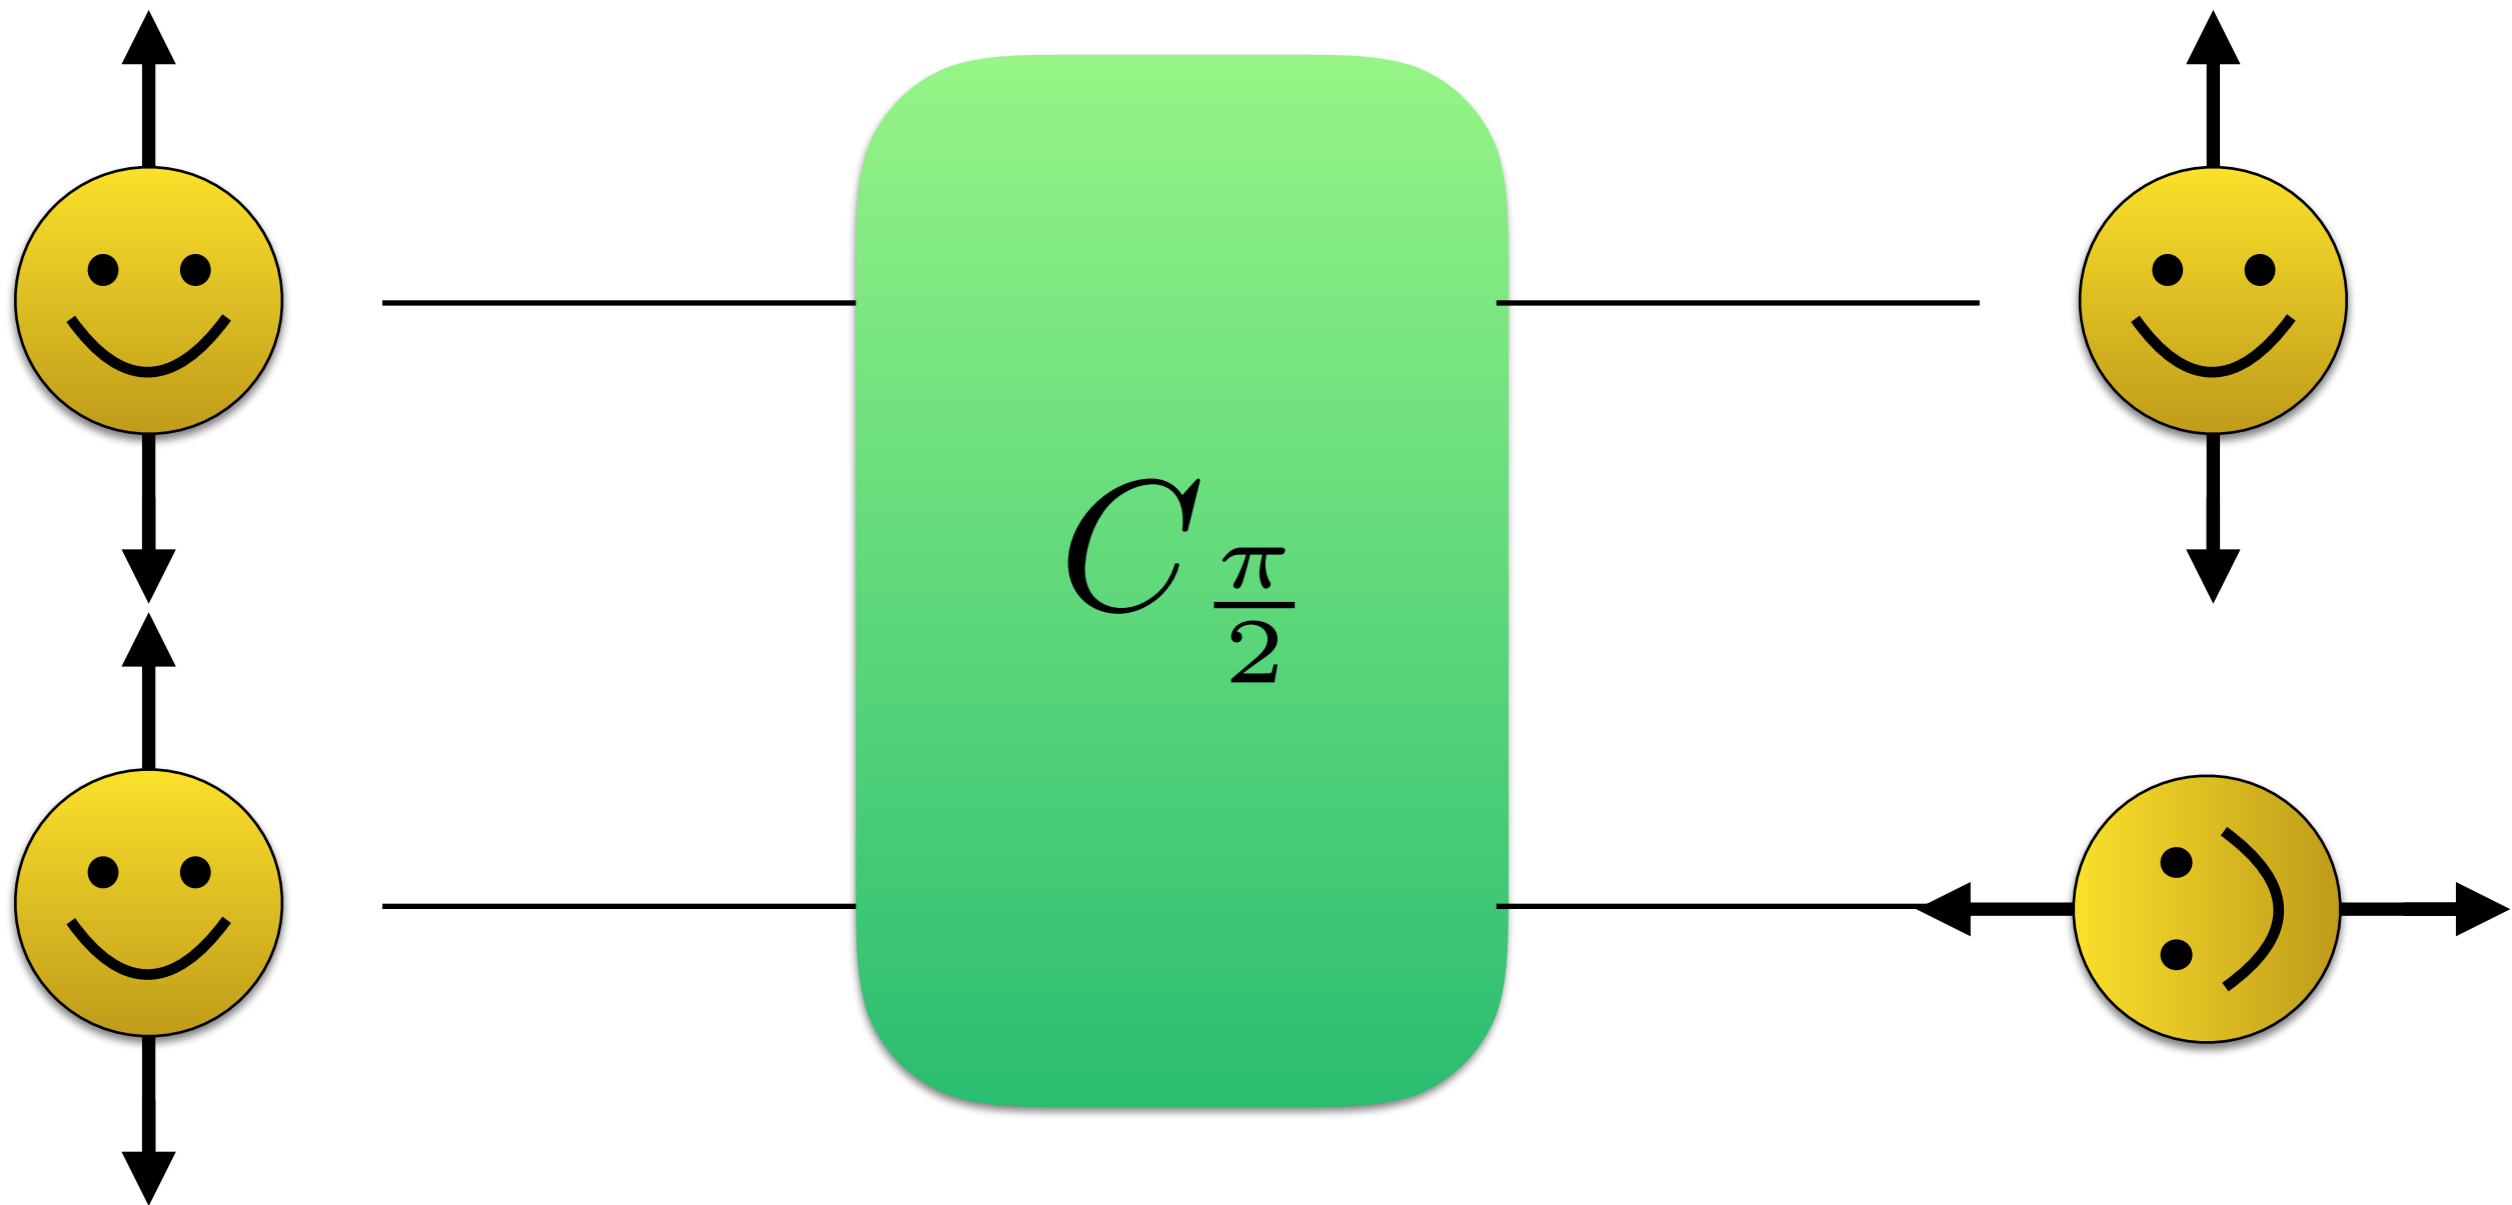

# Example with polarisation

Two-qubit gates create **controlled** rotations

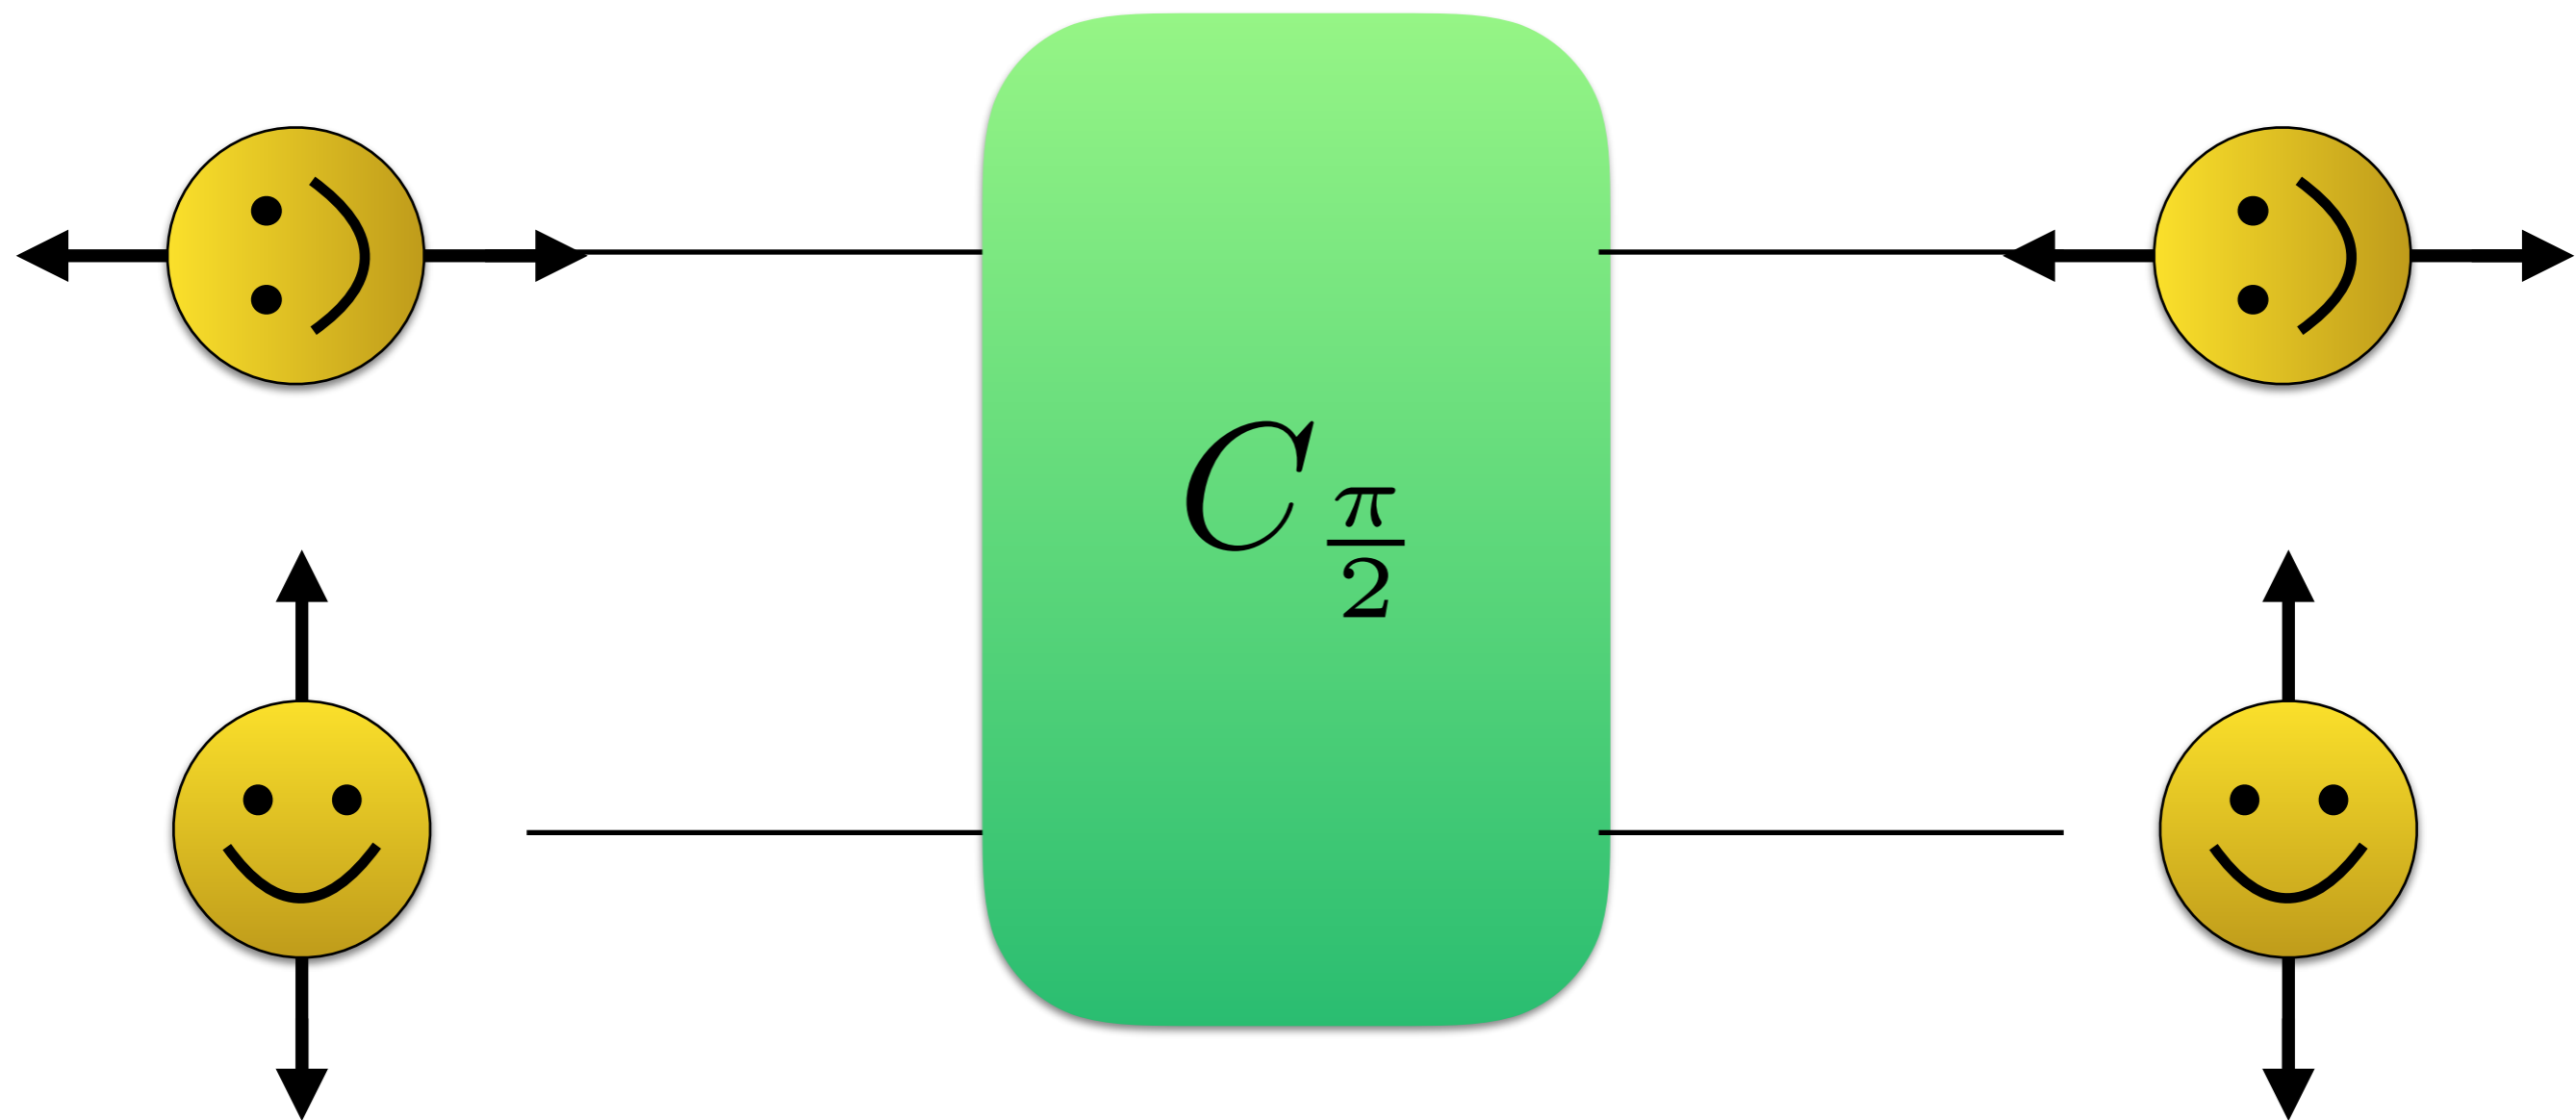

# Example with polarisation

Two-qubit gates create **controlled** rotations

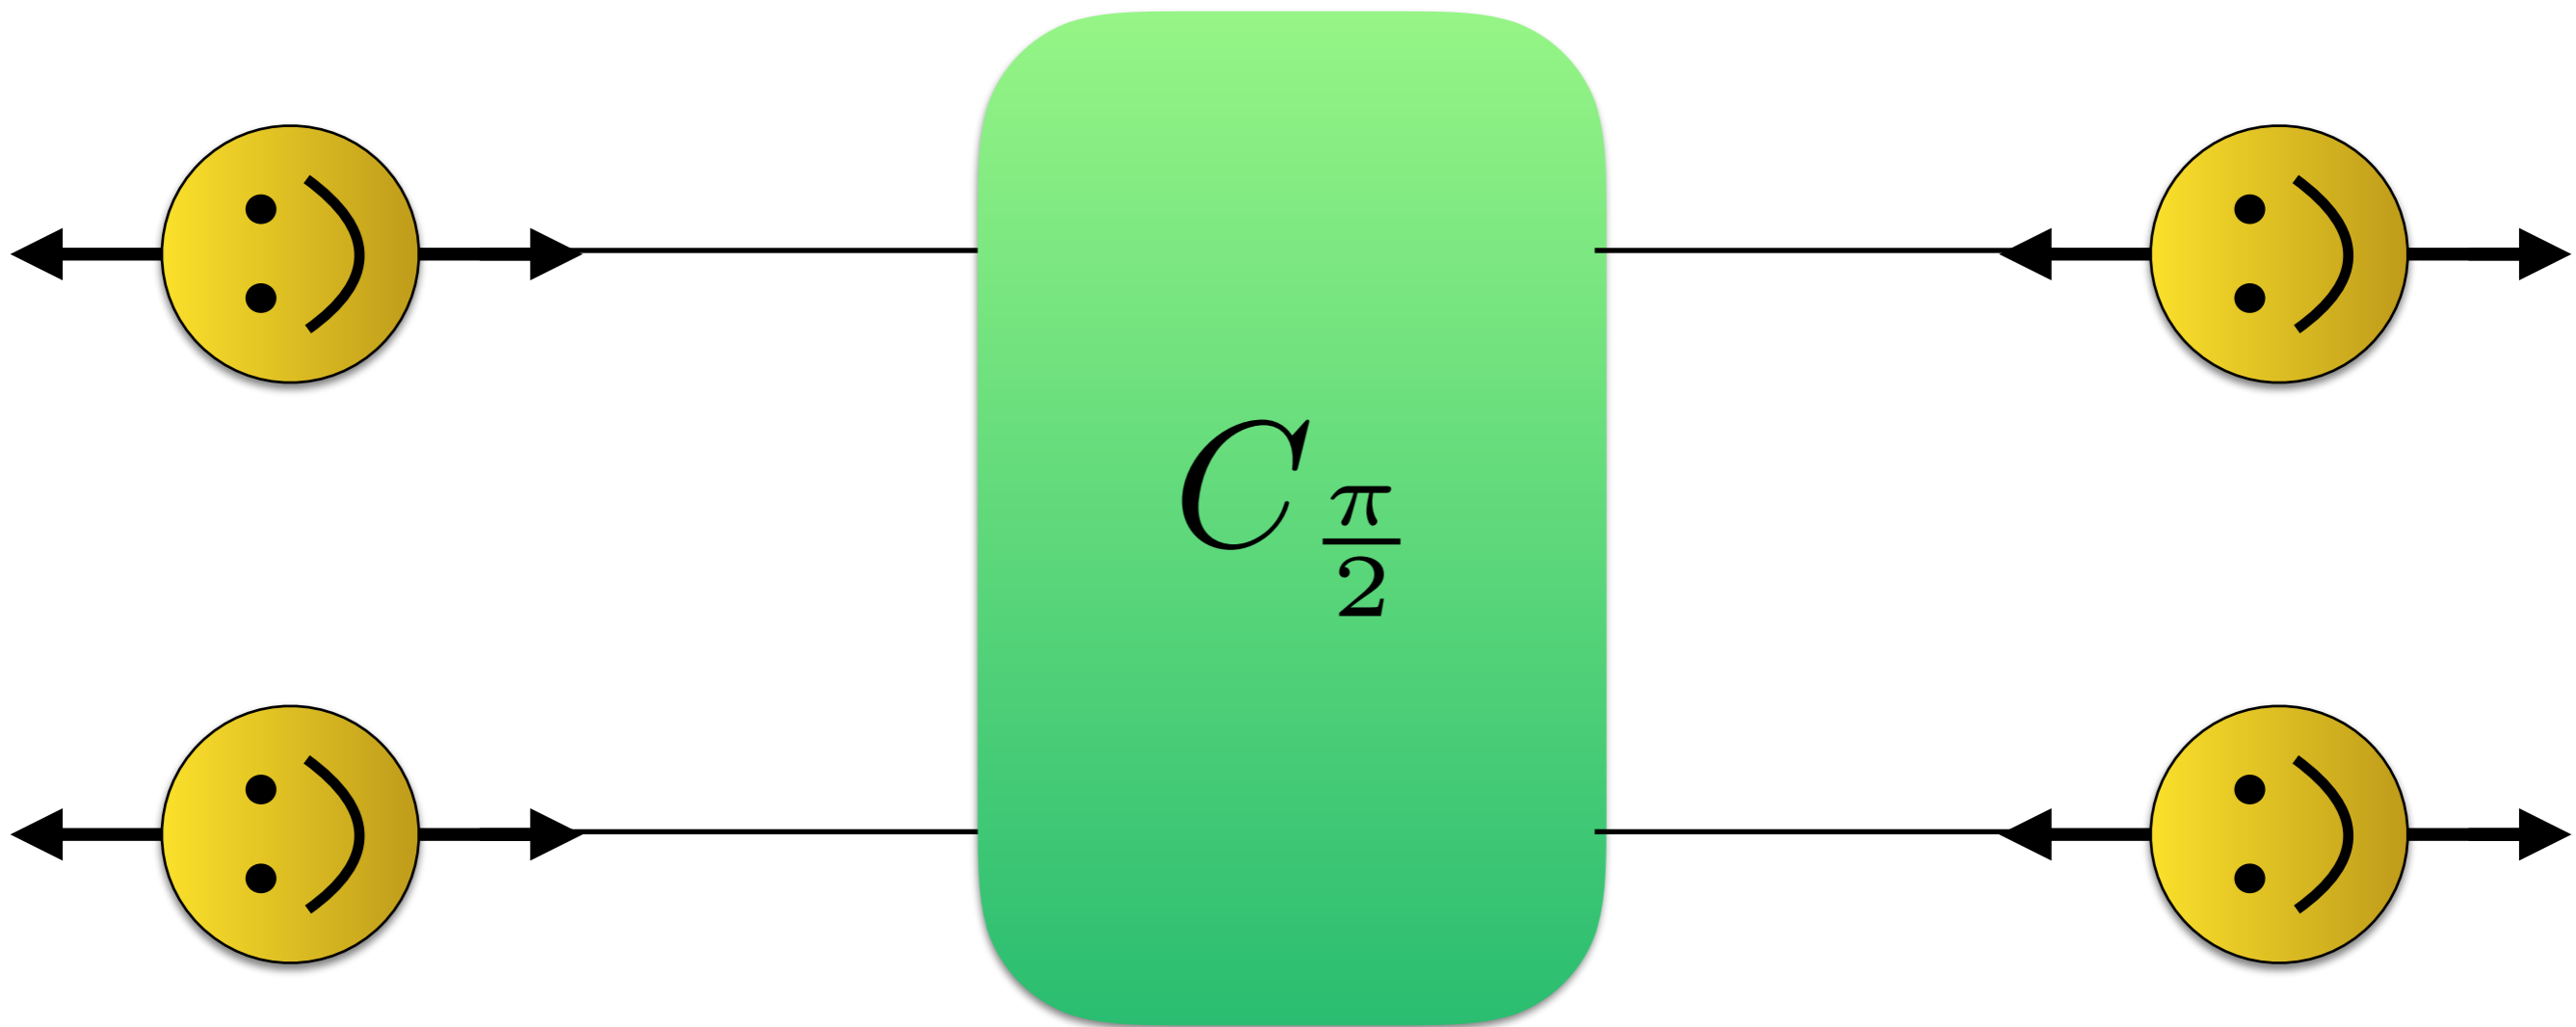

# Example with polarisation

Two-qubit gates create **controlled** rotations

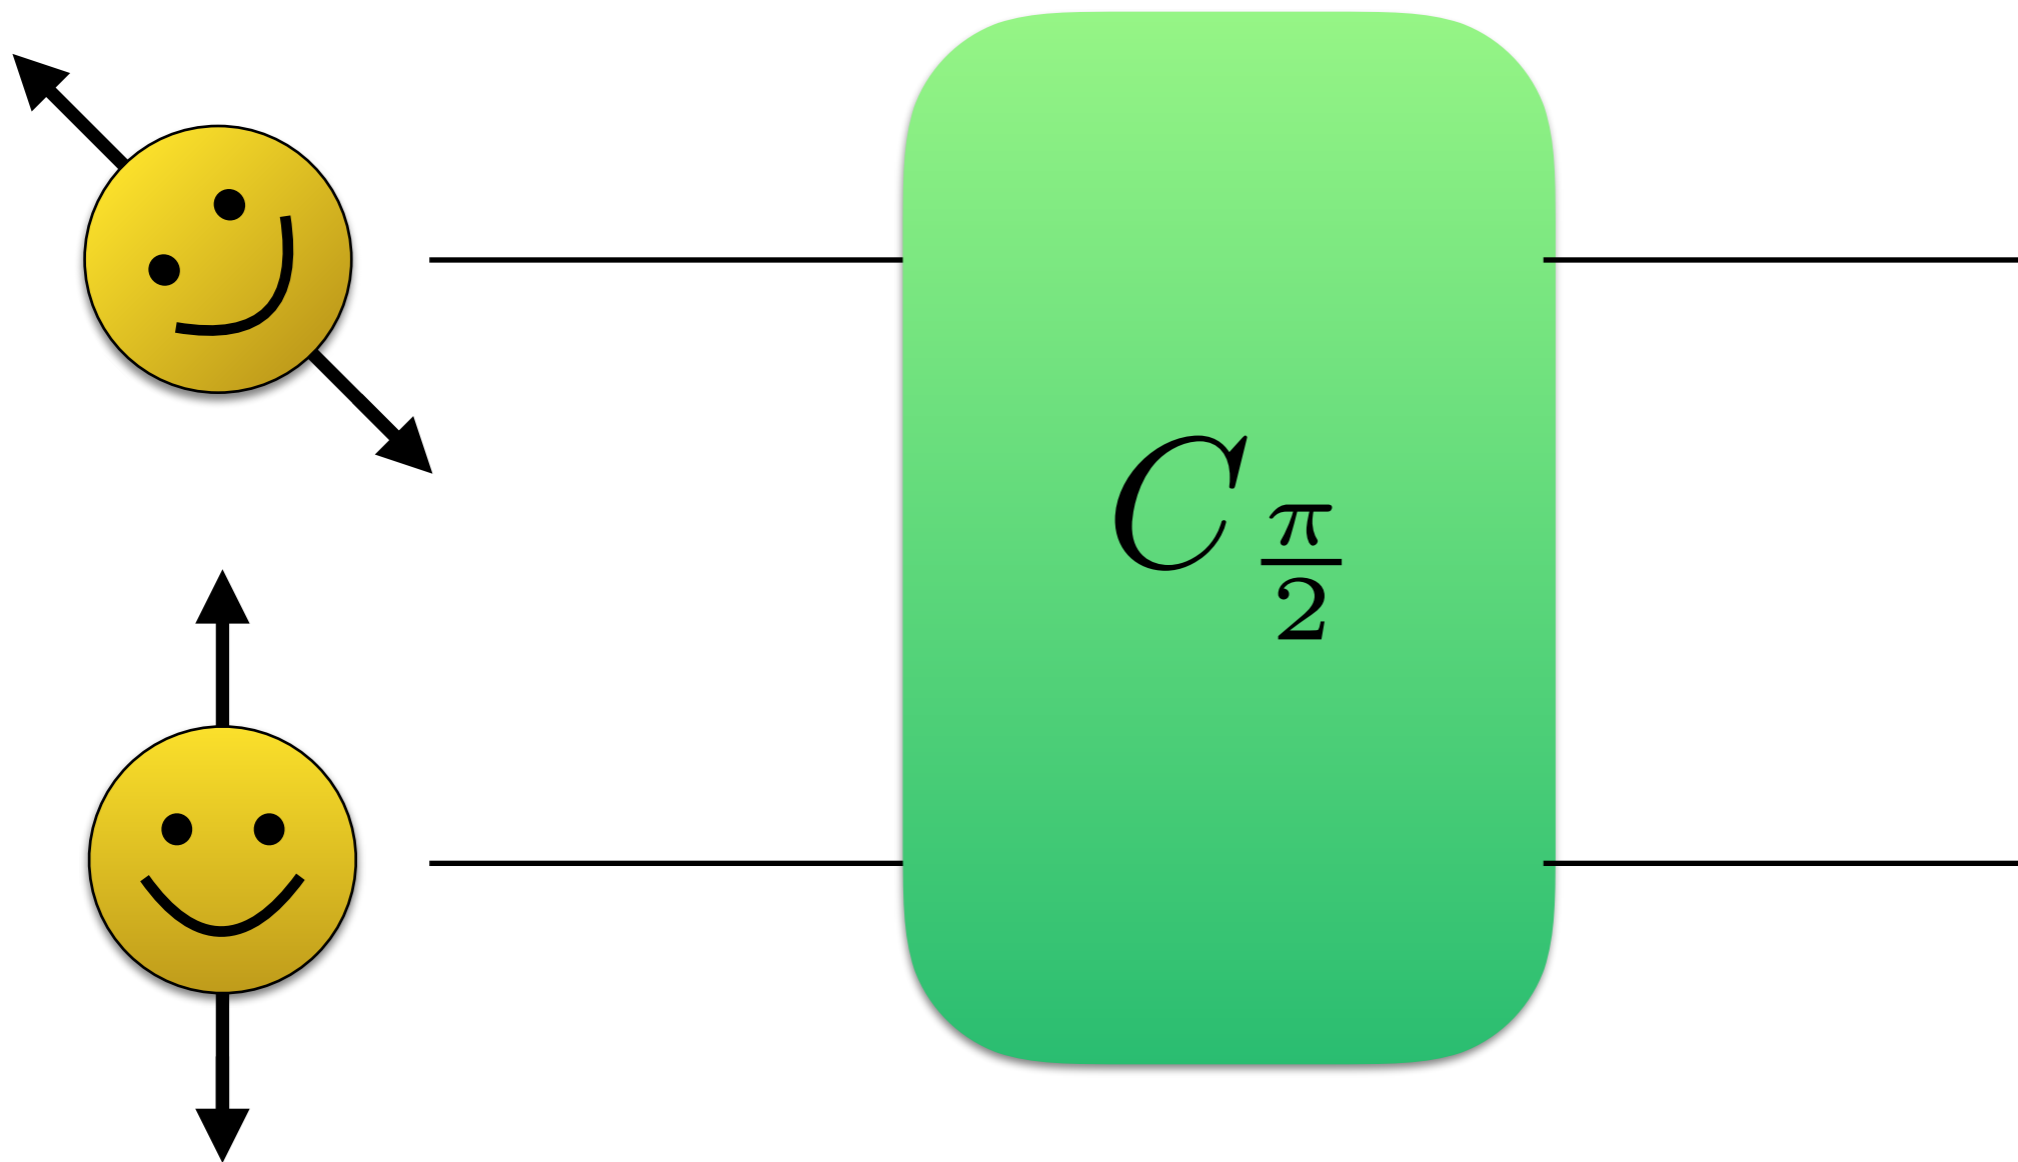

# Example with polarisation

Two-qubit gates create **controlled** rotations

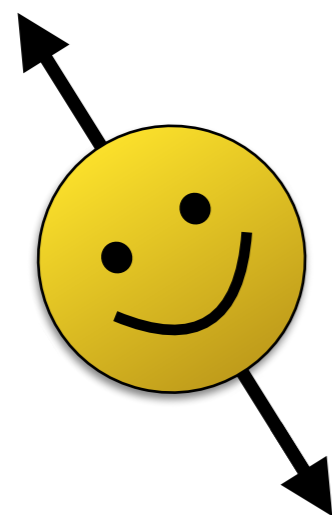

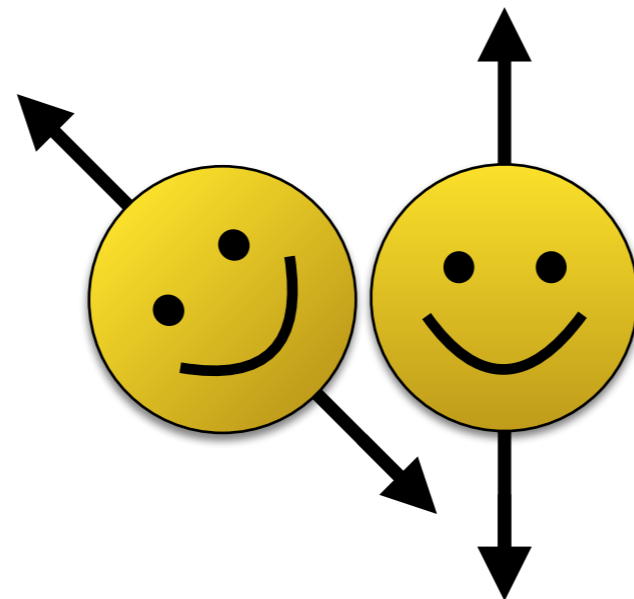

# Example with polarisation

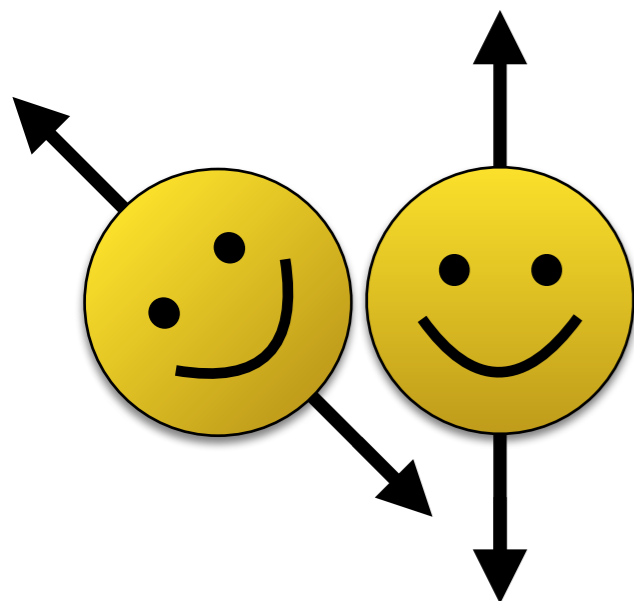

What about this...

# Example with polarisation

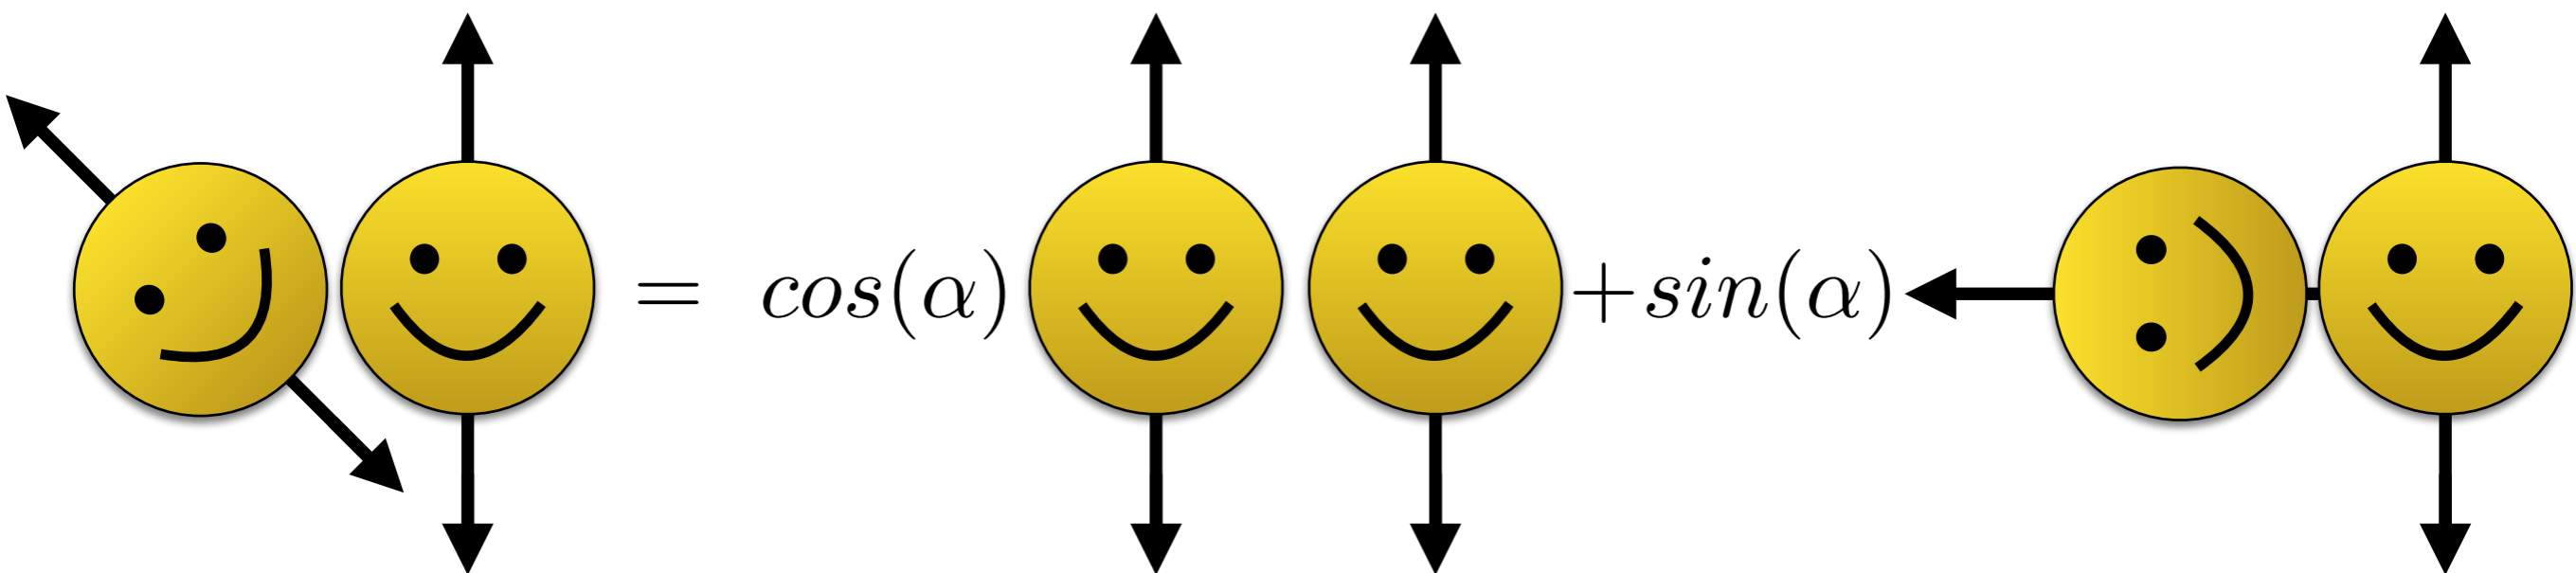

$$= \cos(\alpha) \text{ (face with vertical arrows) } + \sin(\alpha) \text{ (face with horizontal arrows) }$$

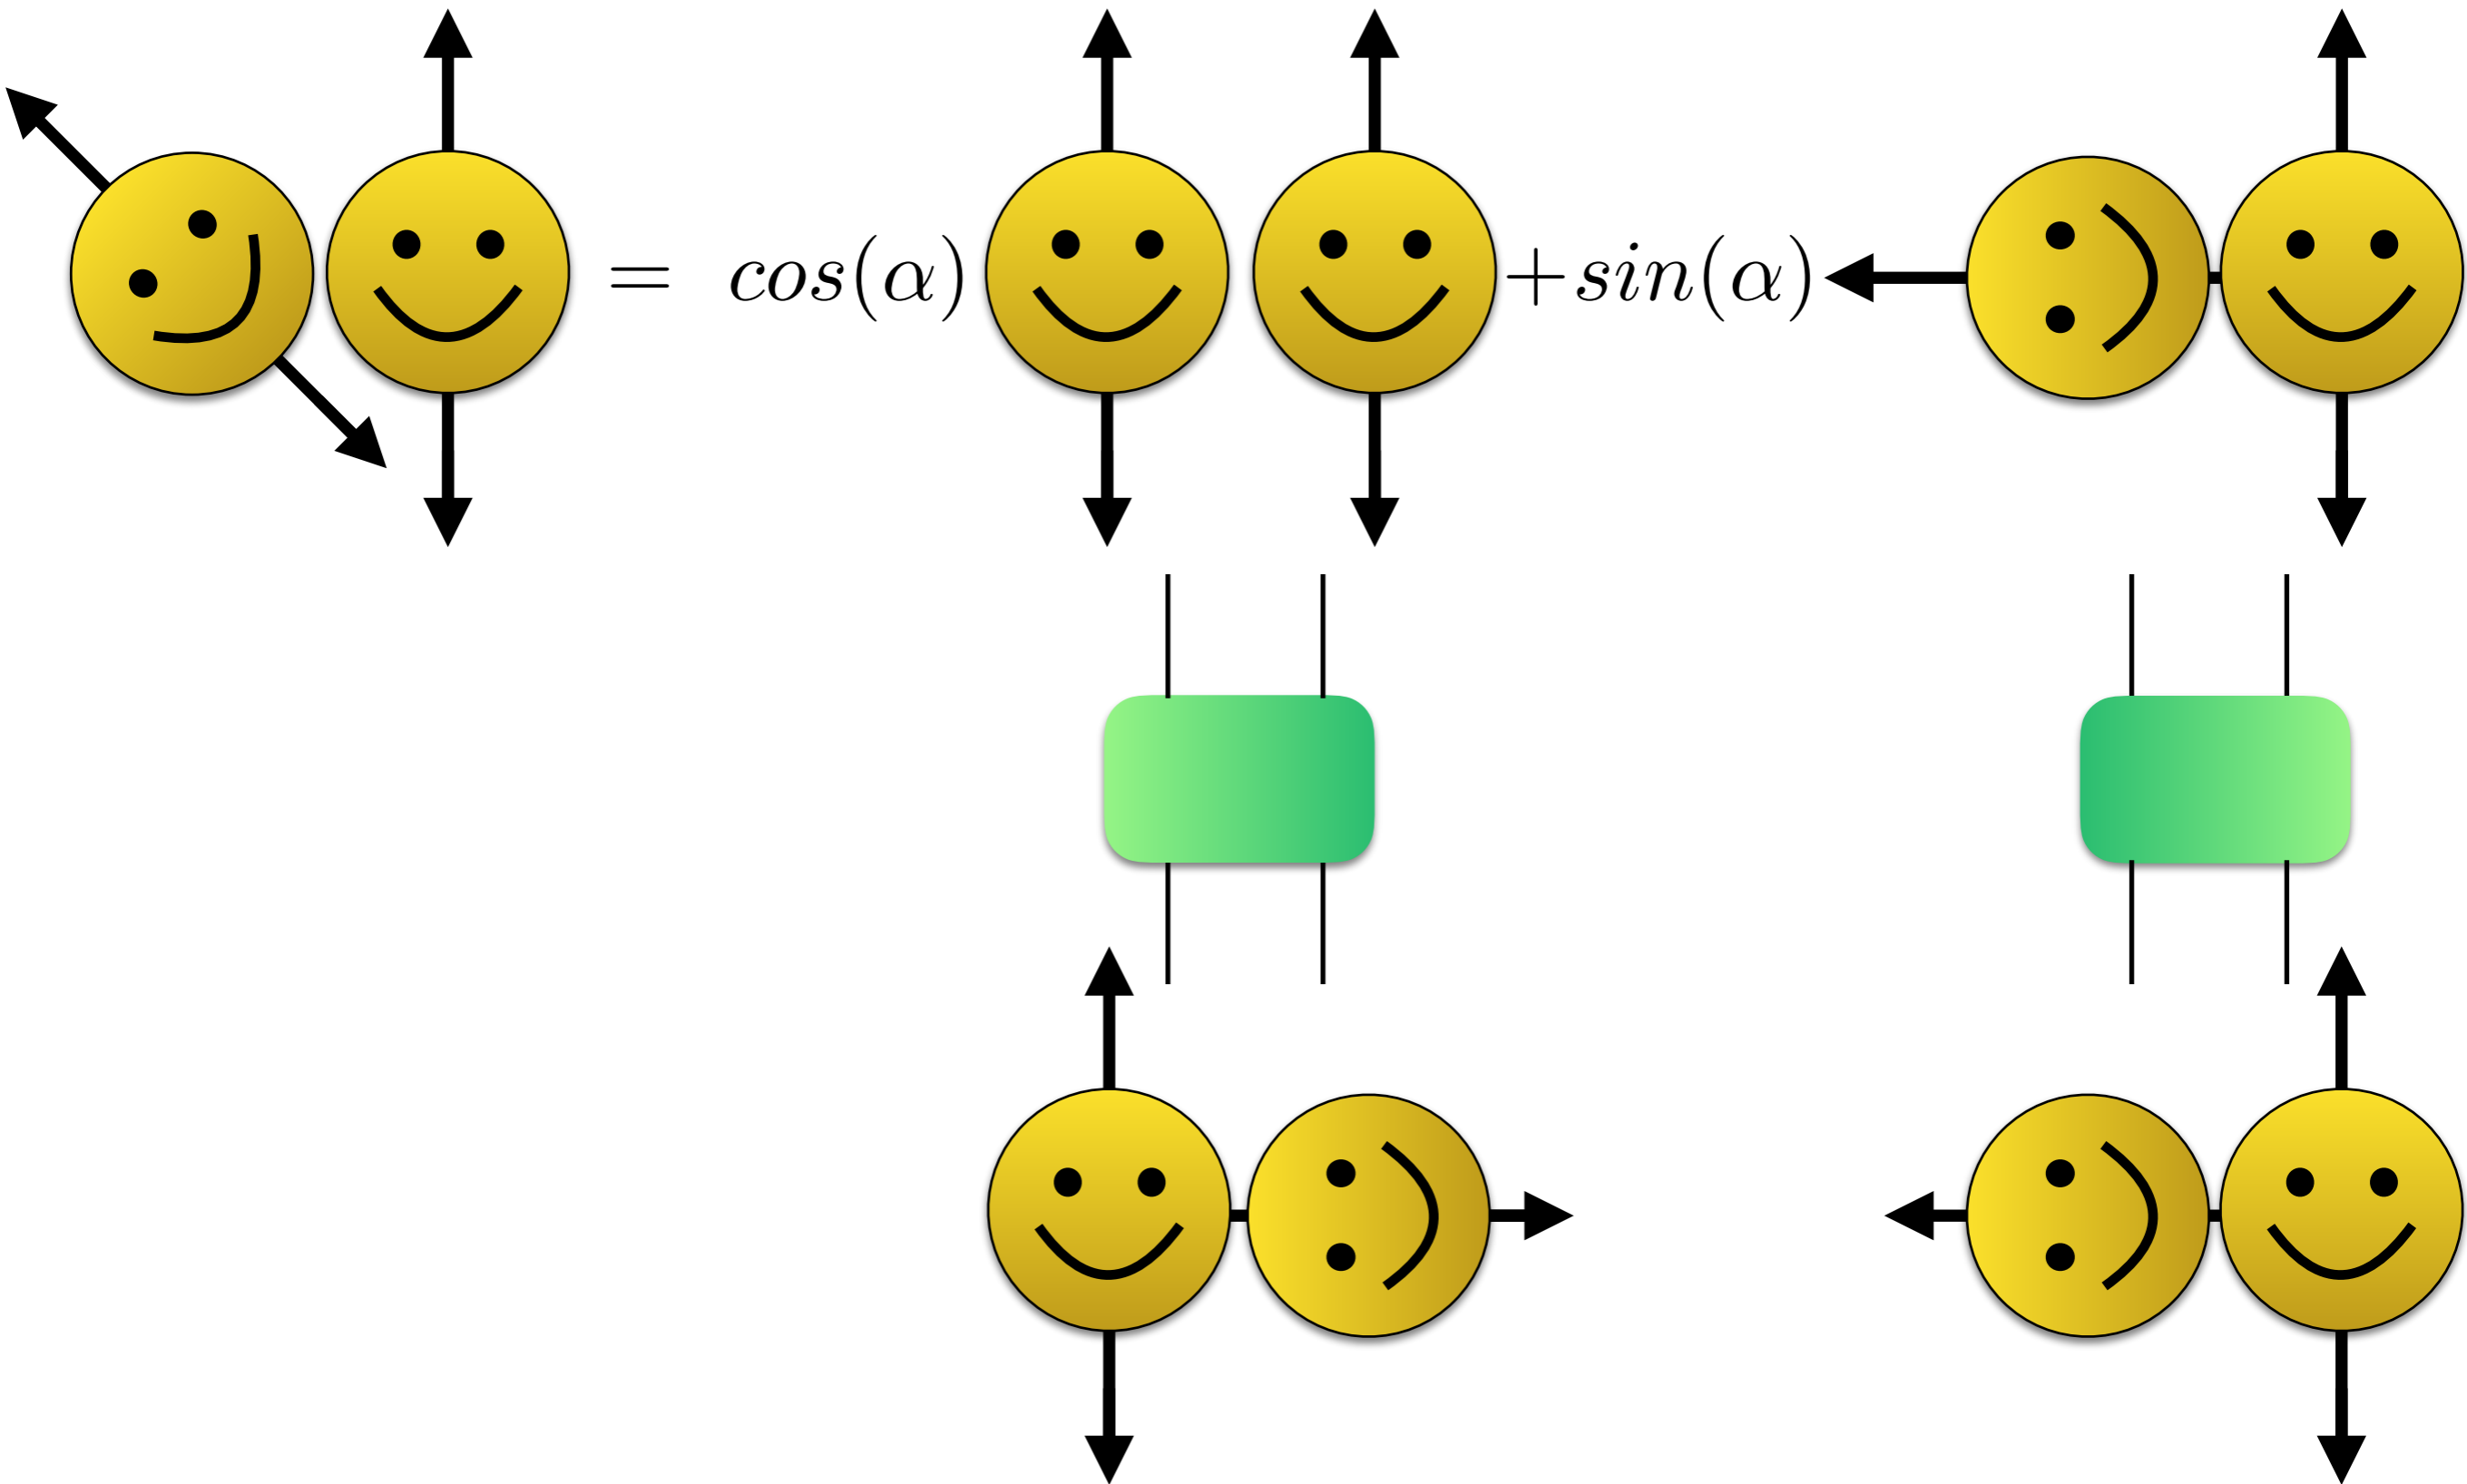

$$= \cos(\alpha) \text{ (two faces with vertical arrows) } + \sin(\alpha) \text{ (face with horizontal arrows and a face with vertical arrows) }$$

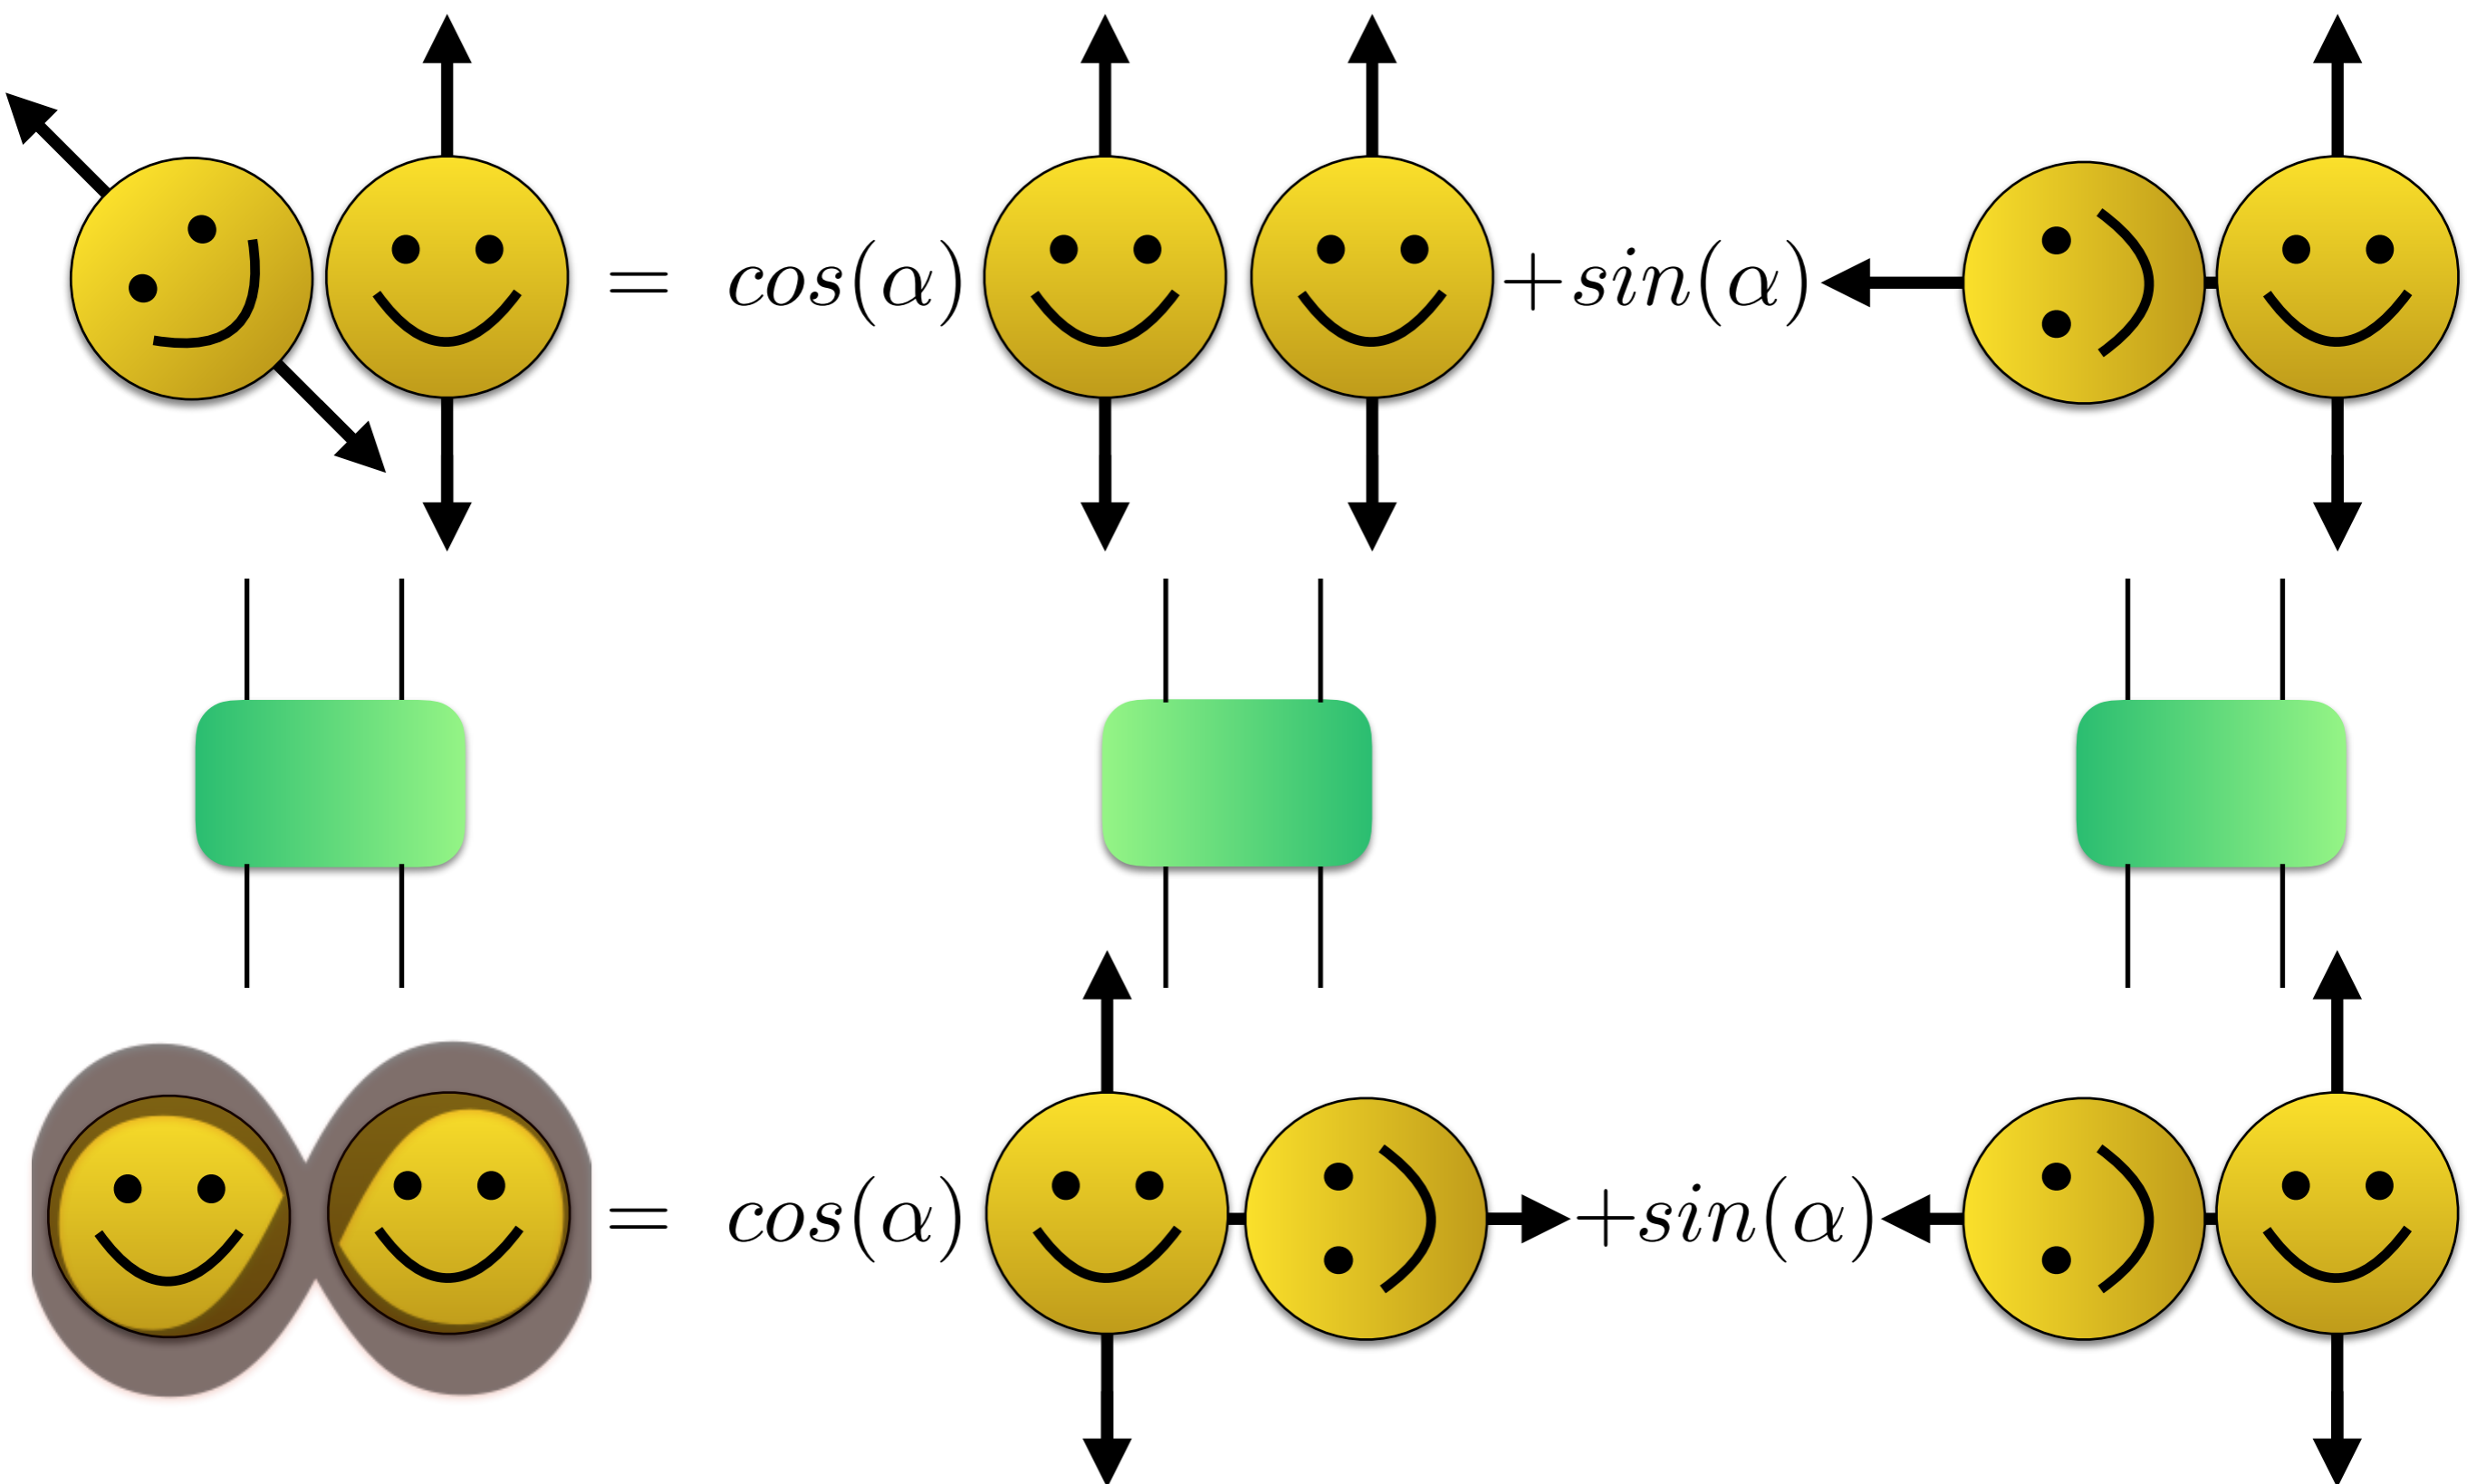

# Example with polarisation

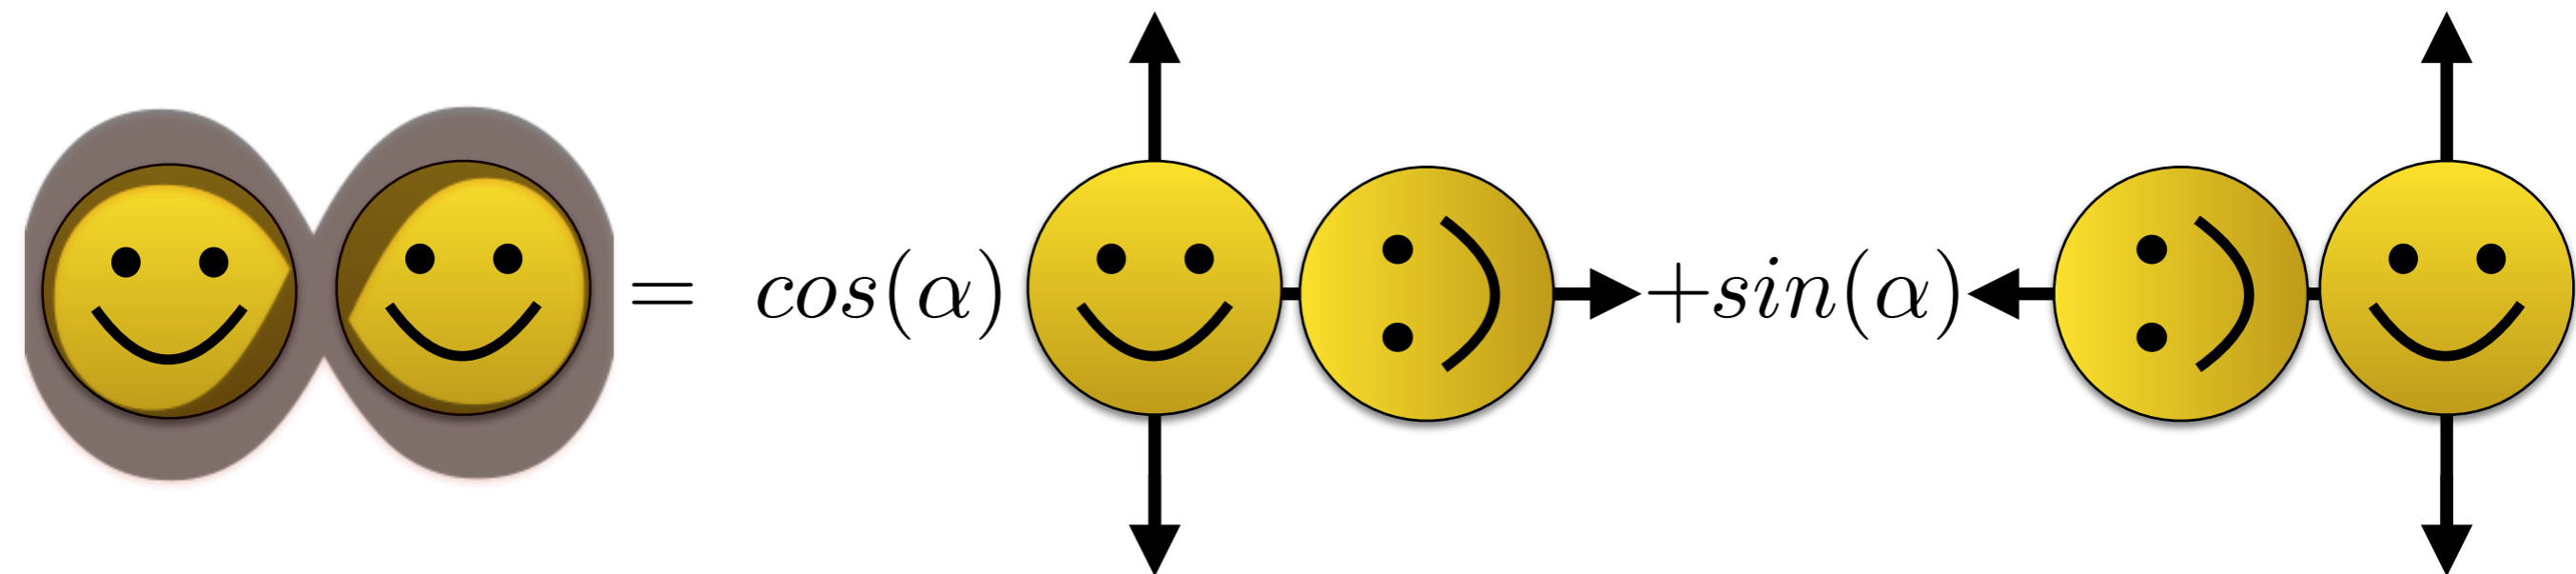

# Example with polarisation

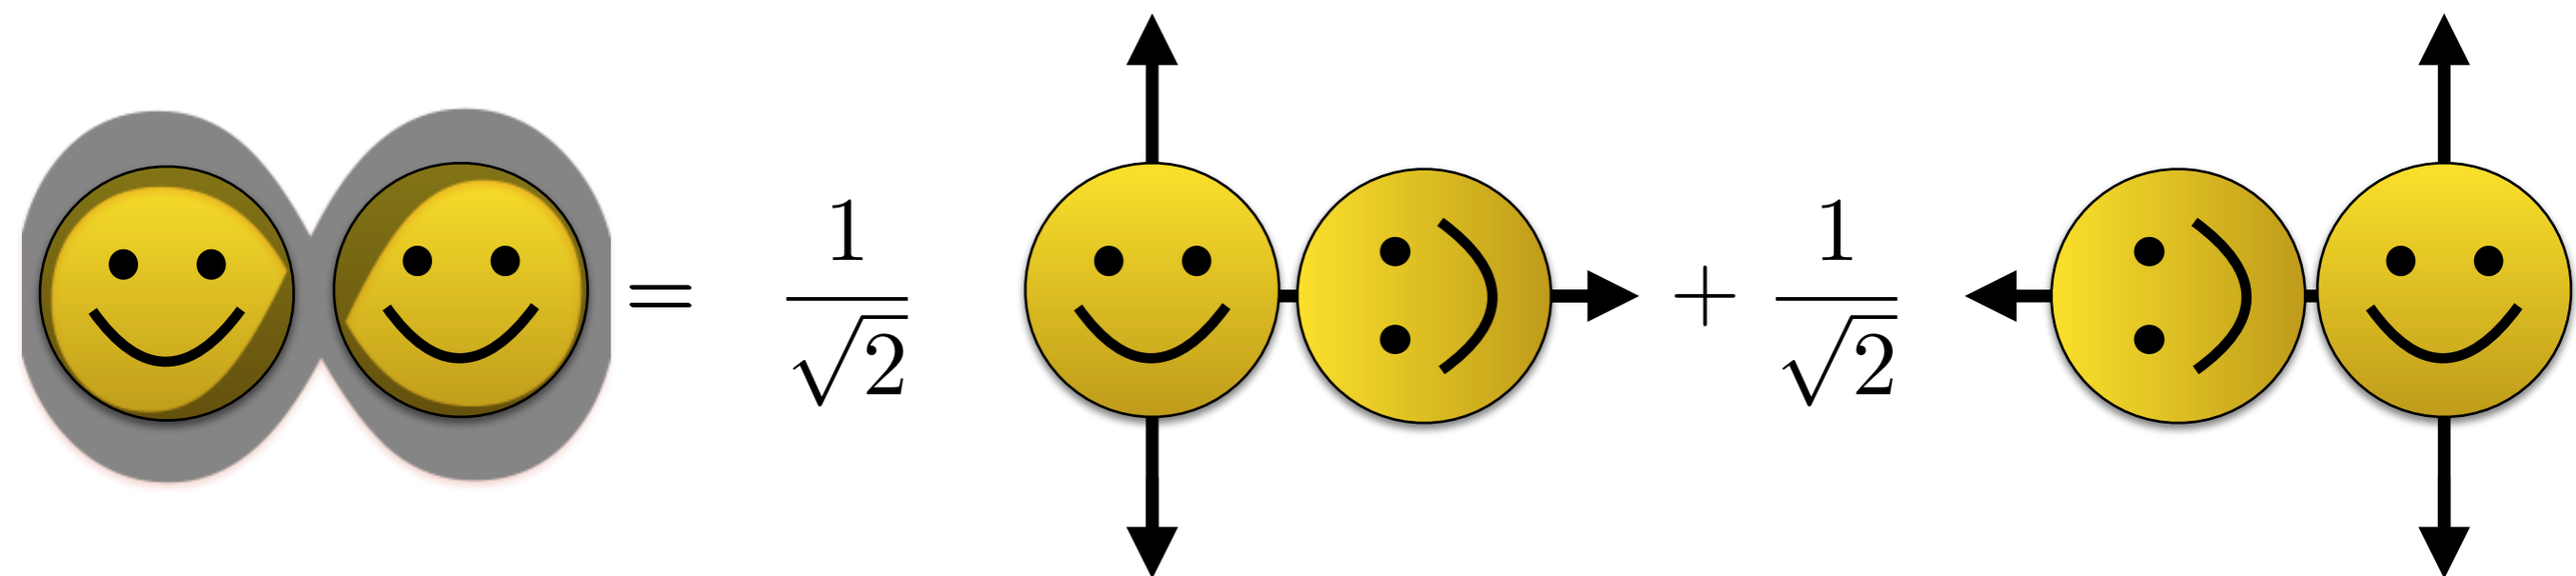

# Example with polarisation

## Example with polarisation

Take  $\alpha = \pi/4$

The photons are **entangled**

# Example with polarisation

Diagram illustrating the decomposition of a horizontal polarized state into a superposition of vertical and horizontal polarized states. On the left, two yellow smiley faces are shown side-by-side, each with a horizontal arrow pointing to the right, representing a horizontal polarized state. This is equal to the sum of two terms. The first term is  $\frac{1}{\sqrt{2}}$  times two yellow smiley faces, each with a vertical arrow pointing up and down, representing a vertical polarized state. The second term is  $+\frac{1}{\sqrt{2}}$  times two yellow smiley faces, each with a horizontal arrow pointing to the left and right, representing a horizontal polarized state.

$$\text{Horizontal Polarized State} = \frac{1}{\sqrt{2}} \text{Vertical Polarized State} + \frac{1}{\sqrt{2}} \text{Horizontal Polarized State}$$

Diagram illustrating the decomposition of a horizontal polarized state into a superposition of states rotated by an angle  $\alpha$ . On the left, two yellow smiley faces are shown side-by-side, each with a horizontal arrow pointing to the right, representing a horizontal polarized state. This is equal to the sum of two terms. The first term is  $\frac{1}{\sqrt{2}}$  times two yellow smiley faces, each with a vertical arrow pointing up and down, representing a vertical polarized state. The second term is  $+\frac{1}{\sqrt{2}}$  times two yellow smiley faces, each with a horizontal arrow pointing to the left and right, representing a horizontal polarized state. A dashed line indicates the angle  $\alpha$  between the vertical and horizontal axes.

$$\text{Horizontal Polarized State} = \frac{1}{\sqrt{2}} \text{Vertical Polarized State} + \frac{1}{\sqrt{2}} \text{Horizontal Polarized State}$$

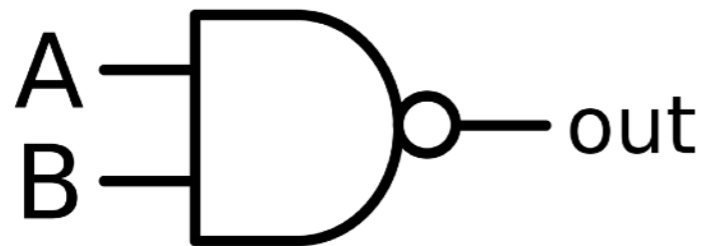

This is true for any  $\alpha$

# Universality

## Classical

Set of gates that can implement any boolean function

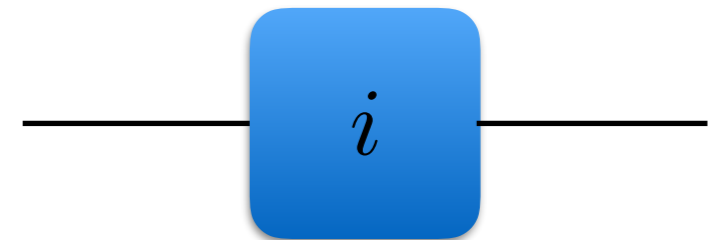

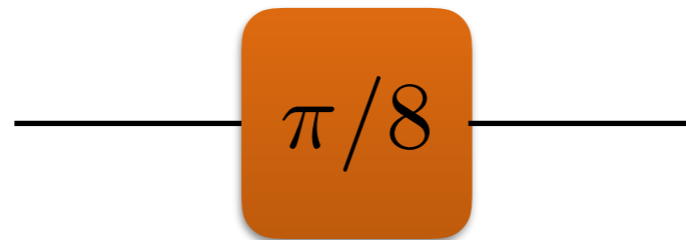

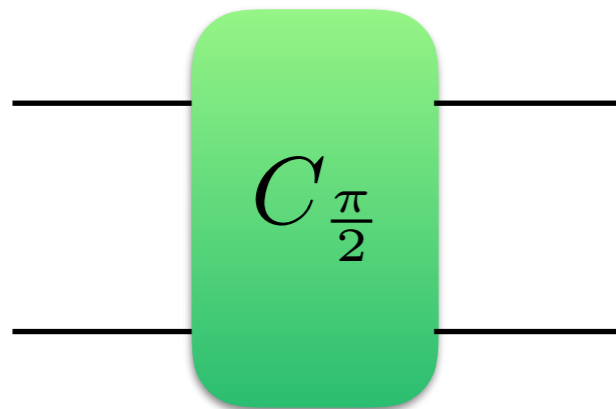

$\{AND, OR, NOT\}$

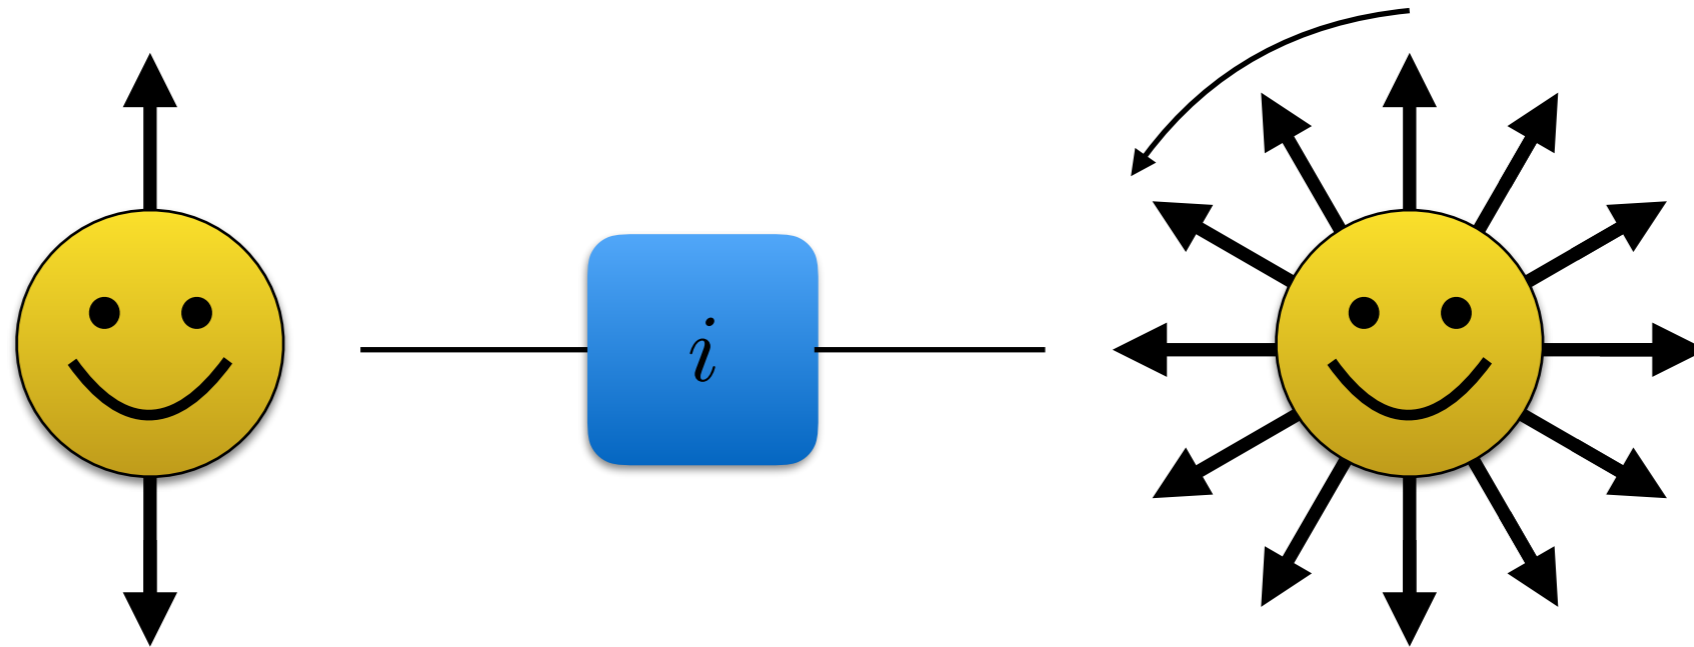

$\{NAND\} \quad out = NOT(AND(A, B))$

## Quantum

Set of gates that can implement any quantum operation

# The $i$ gate

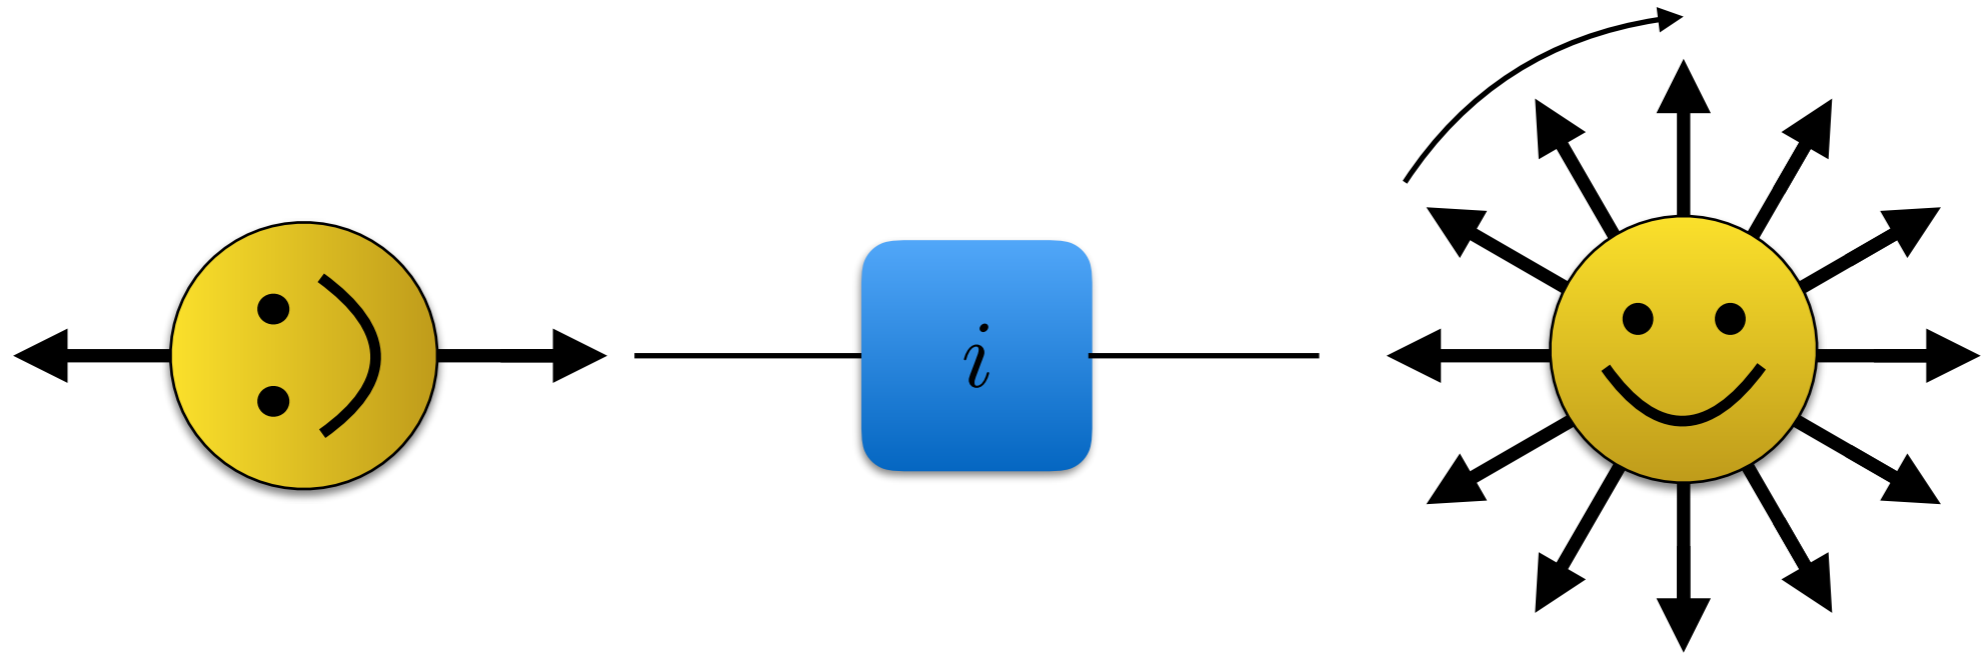

Circular polarisation

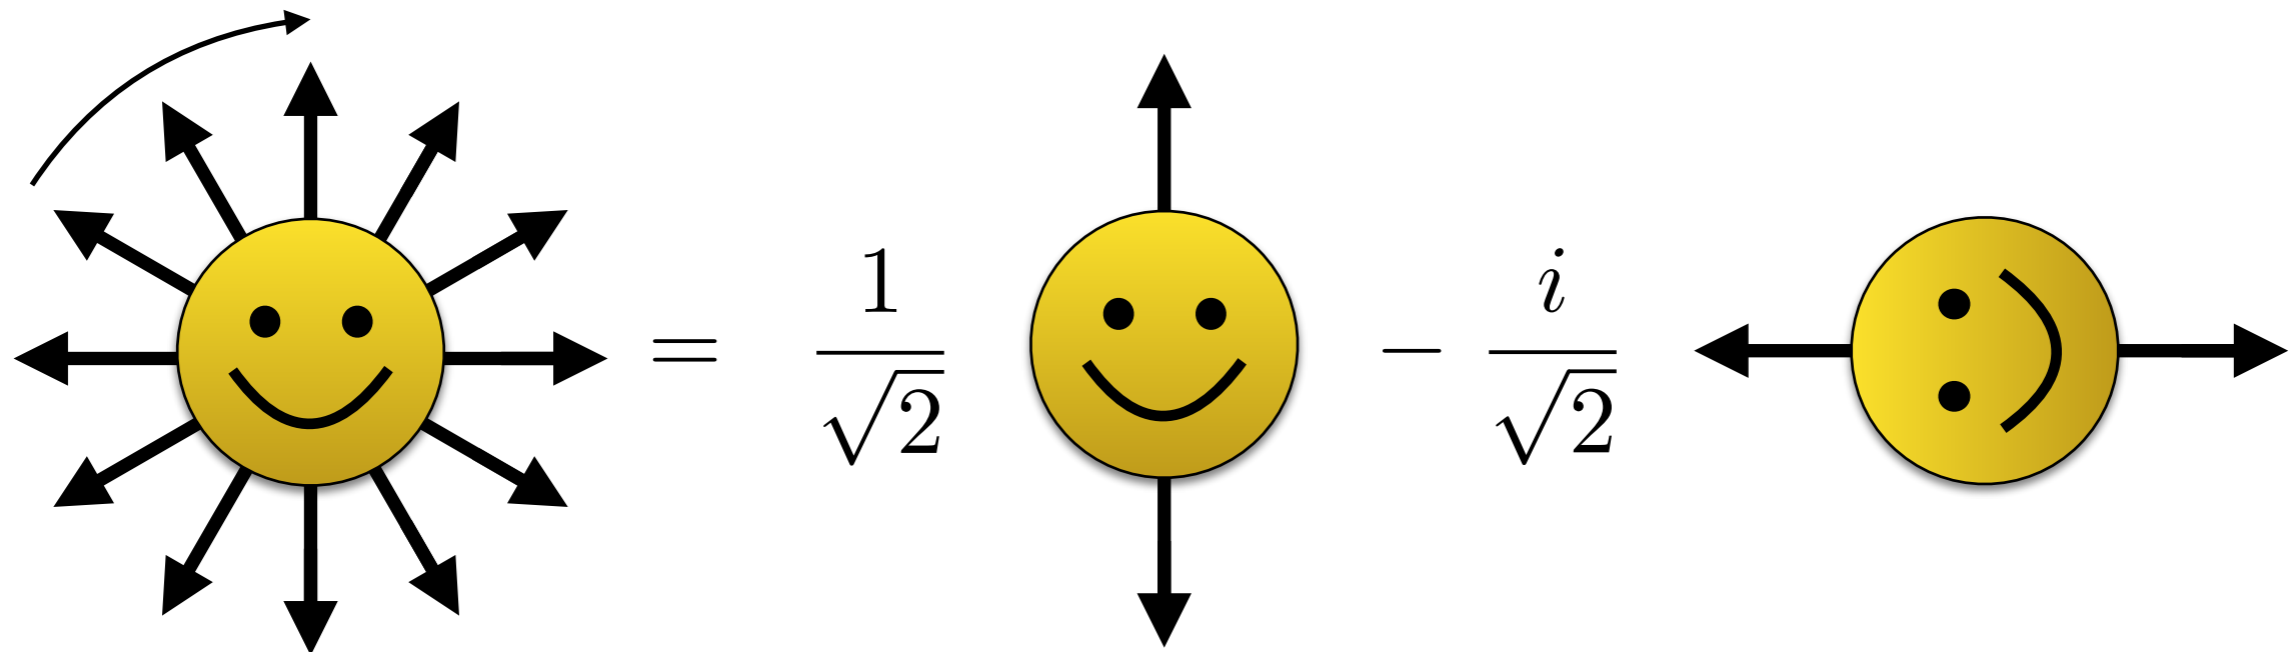

An equation showing the decomposition of circular polarization. On the left is a yellow smiley face with ten black arrows pointing outwards in a circular pattern, representing circular polarization. This is followed by an equals sign. To the right of the equals sign is the term  $\frac{1}{\sqrt{2}}$  multiplied by a yellow smiley face with two vertical arrows (one up, one down), representing linear polarization. This is followed by a plus sign and the term  $\frac{i}{\sqrt{2}}$  multiplied by a yellow smiley face with two horizontal arrows (one left, one right), representing a phase-shifted linear polarization state.

$$\text{Circular Polarisation} = \frac{1}{\sqrt{2}} \text{Linear Polarisation} + \frac{i}{\sqrt{2}} \text{Phase-shifted Linear Polarisation}$$

# The $i$ gate

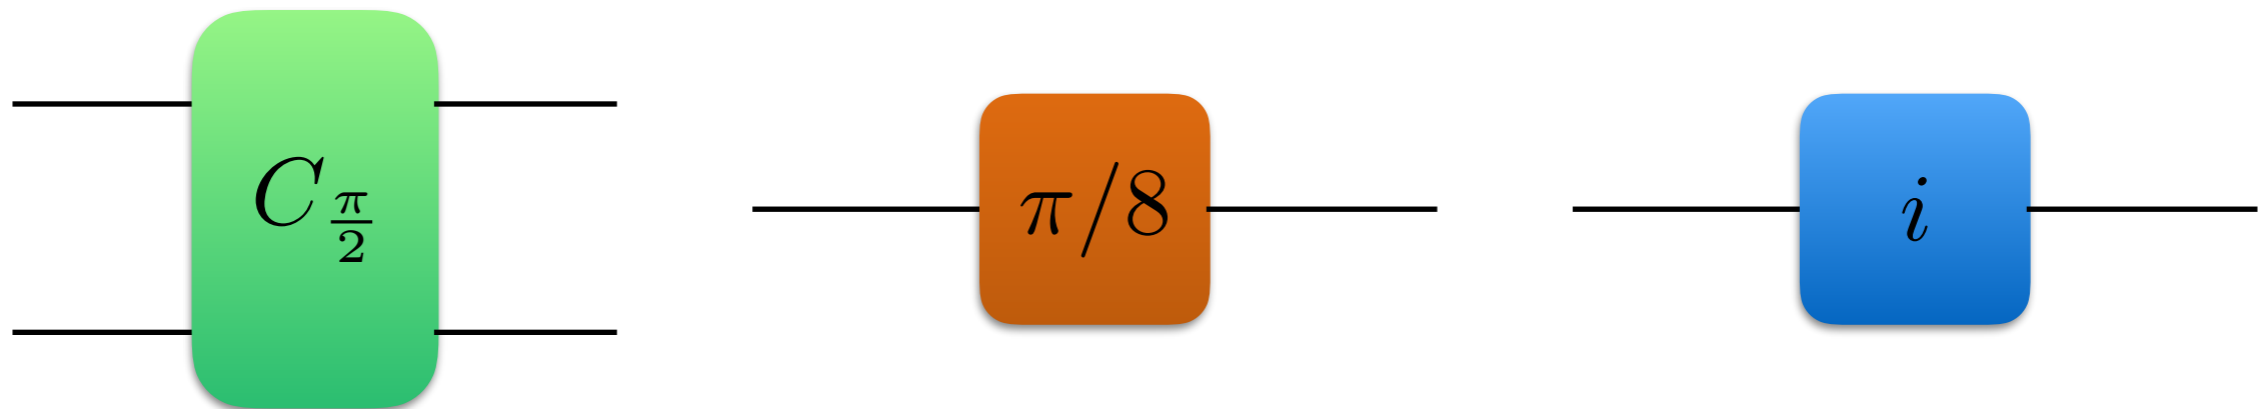

## Circular polarisation

# Imperfections

Gates are usually imperfect

10% of the time acts **correctly**  
90% of the time does something else

Two-qubit gates are especially problematic!

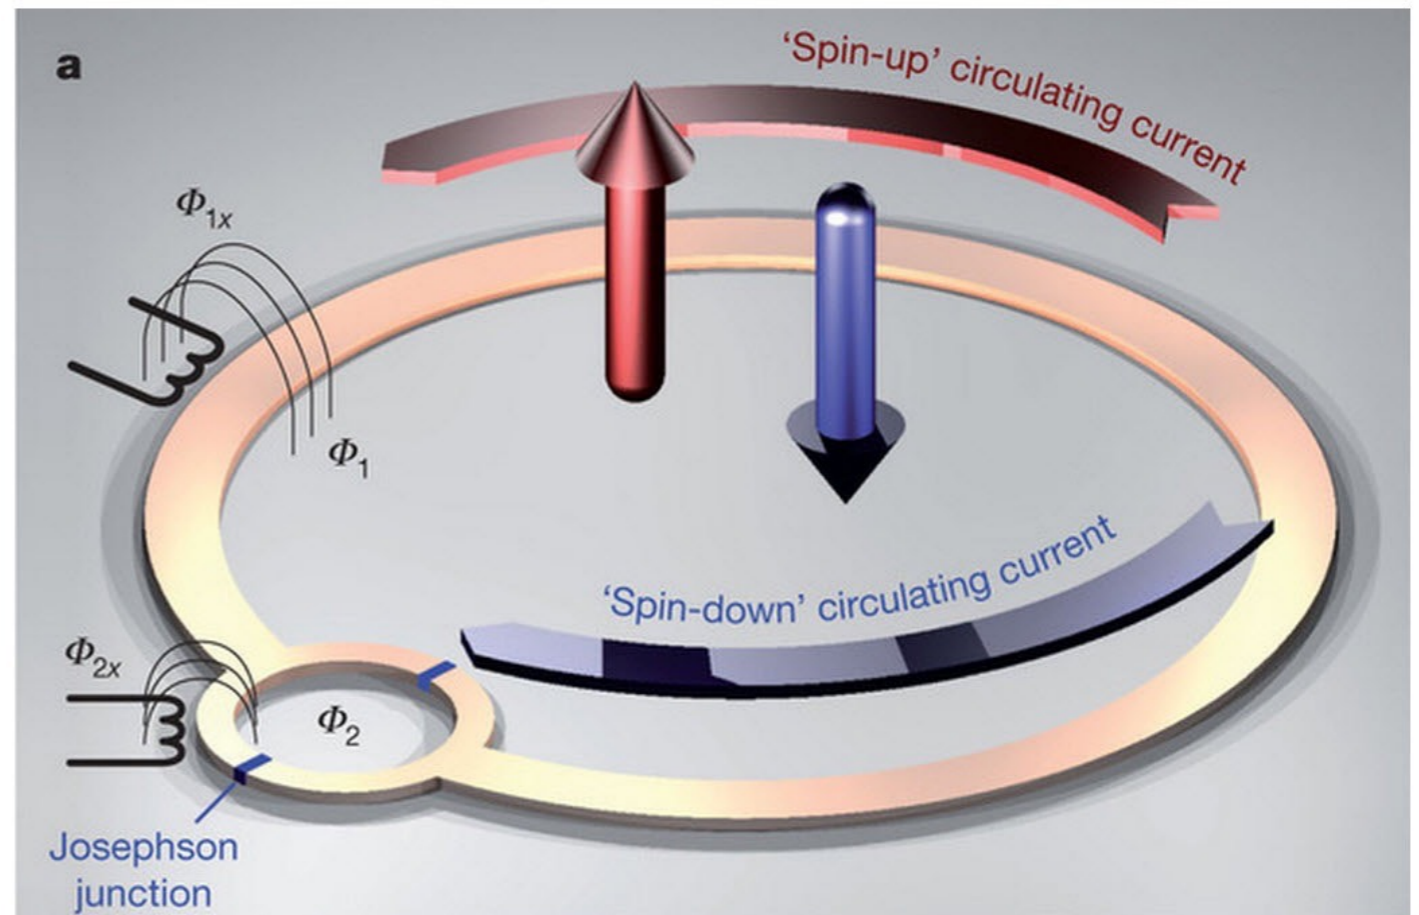

For large circuits, gates should be almost perfect

**Fault tolerant** protocols can handle small errors

# Other hardware implementations

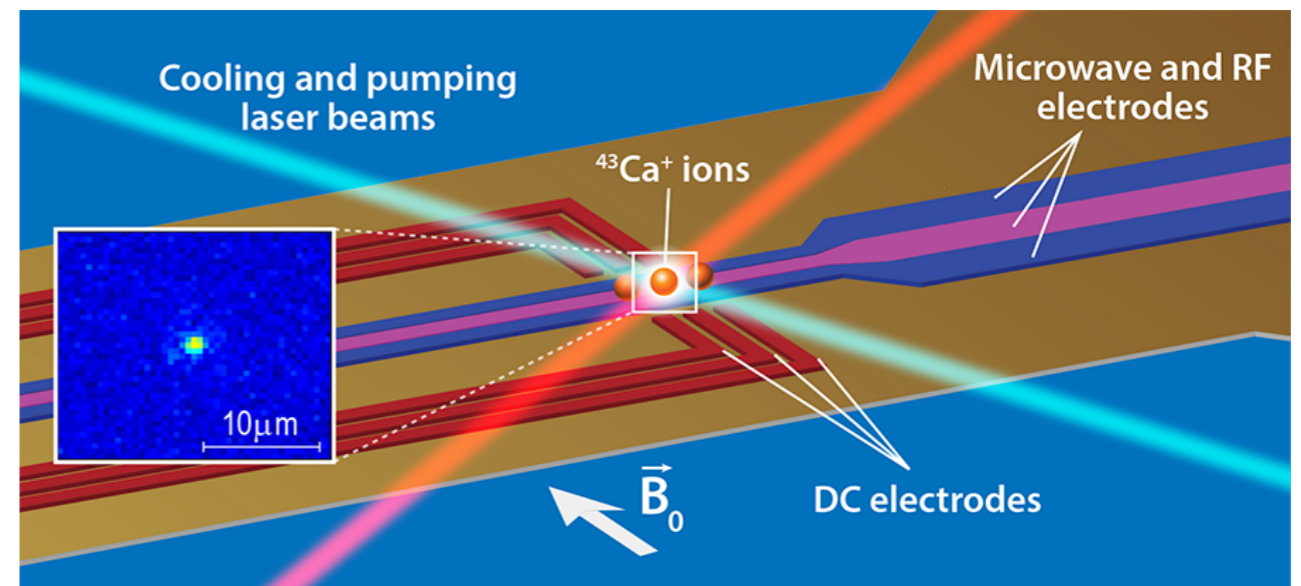

Superconducting qubits  
(SQUIDs)

Encoding information  
in current

Ion traps

Encoding information  
in electron spins

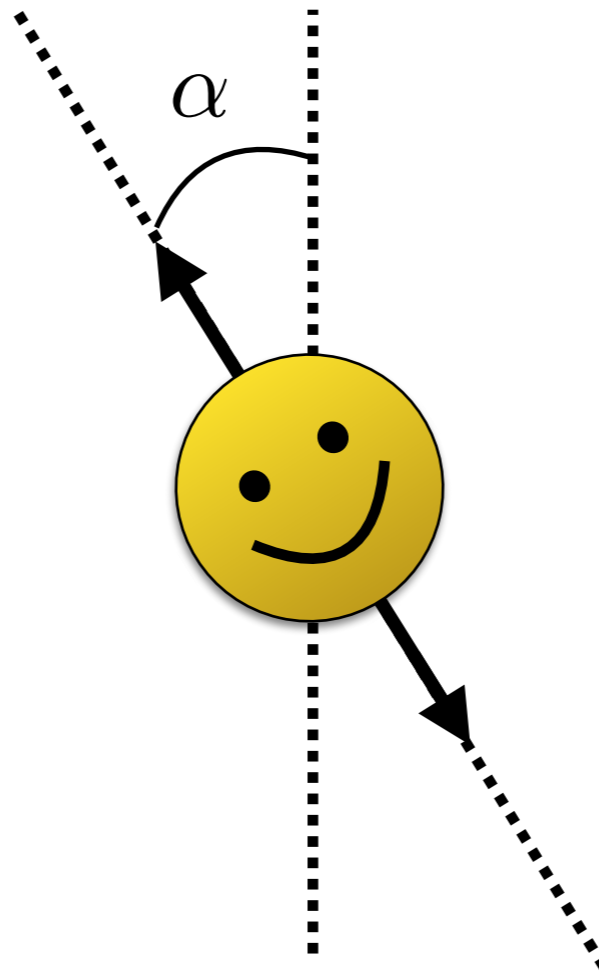

## Existing devices

	# Qubits	Universal	Fault tolerant
<b>D-Wave</b>	2048		
<b>IBM</b>	50		
<b>Rigetti</b>	18		
<b>Google</b>	72?		
<b>Others</b>	<20	Depends	Depends

Pick  $\alpha$  at random from  $\{-\pi/4, 0, \pi/4, \pi/2\}$

Given **one** photon  
in the state

Can you find  $\alpha$ ?

QM says no!

Cannot guess  $\alpha$  with probability greater than  $\frac{1}{2}$

Measurements disturb quantum states

Cannot copy unknown quantum states

# Quantum cryptography

Leveraging “quantum uncertainty” for cryptography

Quantum key distribution (QKD)

Quantum digital signatures (QDS)

Quantum secure random number generation (QRNG)

Quantum money

Blind quantum computation

Quantum secure multi-party computation

# Quantum cryptography

## Quantum-Safe Crypto

IDQ is the world leader in QUANTUM KEY GENERATION, QUANTUM KEY DISTRIBUTION and NETWORK ENCRYPTION

[HOME](#) > [QUANTUM-SAFE CRYPTO](#)

## Quantum-Safe Crypto

ID Quantique provides high-performance network encryption solutions for the protection of data in transit. IDQ's encryption platform can encrypt high throughput traffic up to 100Gbps on local and storage area networks for data back-up and recovery, as well as on fully meshed global WAN networks for international operations.

IDQ uses state-of-the-art algorithms and highly secure quantum key generation and quantum key distribution (quantum cryptography), ensuring that the solutions are "quantum-safe" for the long-term protection of sensitive data into and beyond the quantum era.
